

HEARING
BEFORE THE
CALIFORNIA ENERGY RESOURCES CONSERVATION
AND DEVELOPMENT COMMISSION

In the Matter of:)
)
Application for)
Certification for the) Docket No. 98-AFC-4
SUNRISE COGENERATION AND)
POWER PROJECT (SUNRISE))
_____)

CALIFORNIA ENERGY COMMISSION
FIRST FLOOR HEARING ROOM A
1516 NINTH STREET
SACRAMENTO, CALIFORNIA

FRIDAY, JANUARY 28, 2000
9:10 A.M.

Reported by:
Valorie Phillips
Contract No. 170-99-001

PETERS SHORTHAND REPORTING CORPORATION (916) 362-2345

COMMITTEE MEMBERS PRESENT

Michal Moore, Presiding Member

STAFF PRESENT

Gary Fay, Hearing Officer

Bob Eller, Adviser to Vice Chairman Rohy

Caryn Holmes, Senior Staff Counsel

Marc Pryor

Michael Ringer

Joseph Loyer

REPRESENTING THE APPLICANT

John P. Grattan, Attorney
Scott A. Galati, Attorney
Grattan & Galati
Renaissance Tower
801 K Street, Penthouse Suite
Sacramento, California 95814

David A. Stein
Radian International
1990 North California Boulevard, Suite 500
Walnut Creek, California 94596

Randall Marx
Joy Rogalla
Paula G. Fields
Radian International
10389 Old Placerville Road
Sacramento, California 95827

Richard M. Casagrande
RAM Environmental Engineering Services, Inc.
3333 Gibson Street, Suite 200
Bakersfield, California 93308

INTERVENORS

Katherine S. Poole, Attorney, representing CURE
Adams Broadwell Joseph & Cardozo
651 Gateway Boulevard, Suite 900
South San Francisco, California 94080

J. Phyllis Fox
Environmental Management
2530 Etna Street
Berkeley, California 94704-3115

Bruce W. Page
Bruce W. Page Consulting
439 Kearney Street
El Cerrito, California 94530

ALSO PRESENT

Sayed Sadredin
San Joaquin Valley Air Pollution Control District
1990 E. Gettysburg Avenue
Fresno, California 93726-0244

1 P R O C E E D I N G S

2 9:10 a.m.

3 PRESIDING MEMBER MOORE: Good morning,
4 everyone. I'm Michal Moore, I'm the Presiding and
5 the only Member of the Siting Committee now on the
6 Sunrise case. I'm joined on the dais by Gary Fay,
7 my Hearing Officer. We'll conduct today's
8 evidentiary hearings concerning water and air
9 quality.

10 We've entertained a request from the
11 applicant to take the water section first, they
12 have a witness who has to depart. We'll indulge
13 them in that.

14 And let me just first, though, start
15 with any housekeeping items that anyone would like
16 to bring up. Mr. Grattan?

17 MR. GRATTAN: I have no housekeeping
18 items. Maybe after air quality we can sit back
19 and see where we are.

20 PRESIDING MEMBER MOORE: Caryn.

21 MS. HOLMES: Thank you. There's two
22 issues that I'd like to briefly address. First, I
23 received this morning CURE's testimony on water
24 that was filed, I believe it was yesterday. Staff
25 is in the process of reviewing it.

1 We haven't had a chance yet to talk to
2 DTSC who provided the comments in the original
3 hearing on water upon which staff rested its
4 conditions. We'll have to get back to you later
5 today about what the filing of this testimony
6 means for us.

7 PRESIDING MEMBER MOORE: I understand
8 that, and I read the filing this morning. I
9 haven't seen it before that. Serious business, I
10 understand that. I take it very seriously. I'm
11 not quite sure how we're going to handle it, so
12 I'll just simply say for right now I assume that
13 the applicant had it, has a copy, --

14 MR. GRATTAN: Yes.

15 PRESIDING MEMBER MOORE: -- that they're
16 cogitating on it, as well.

17 I think right now that's about as far as
18 I want to go. I got it. I'll make a
19 determination sometime later. It is pretty clear
20 to me that given the water issues in general, that
21 there will be some other day that this hearing
22 will remain open to, where we'll consider some
23 wrap-up issues. I can't believe now looking at
24 the volume of stuff, that that won't happen.

25 So I'll adjust the schedule and timing

1 today accordingly, but you can anticipate that
2 there will be some day in the very near future
3 where we will all convene again to consider the
4 trailing issues. I don't know what those will be
5 right this instant.

6 You have a second item?

7 MS. HOLMES: The second issue has to do
8 with air quality and the USEPA. I talked with
9 them earlier this morning. The indicated that
10 they had met with Texaco on Wednesday, I believe
11 it was, and that as a result of that meeting they
12 had the same concerns that they expressed at the
13 hearing two weeks ago. In fact, they said that
14 some of their concerns were even stronger now.

15 I asked a question on what that meant
16 for the CEC process. Unfortunately, the person I
17 talked with, Mr. Mullaney, who's in their
18 counsel's offices, was not very familiar with the
19 CEC process. And he wanted to have an opportunity
20 to talk with some of the people who are more
21 familiar with the process.

22 I plan to call him back when we're on
23 break this morning and find out if they have a
24 recommendation for the Commission. Staff, after
25 we have had a chance to talk with EPA, ourselves,

1 will also have a recommendation about how we
2 should proceed with respect to the DOC issue.

3 They also indicated it might be possible
4 for them to talk to the Committee via conference
5 call, as they did at the previous hearing. If
6 that's necessary, or if you want that, we probably
7 need to arrange that now because we have to get a
8 call-in number and do all of those kinds of
9 things.

10 PRESIDING MEMBER MOORE: Well, if that's
11 possible then I would say let's try and do that at
12 1:30 today. And if we can arrange it that that
13 will be the first thing following the luncheon
14 break, then we'll set it up so that --

15 MS. HOLMES: I will talk to them
16 about --

17 PRESIDING MEMBER MOORE: If it happens.

18 MS. HOLMES: I will talk to them about
19 that when I call them back on our morning break.

20 PRESIDING MEMBER MOORE: Great, thank
21 you.

22 MS. HOLMES: Those were my two issues.

23 PRESIDING MEMBER MOORE: Thank you. The
24 intervenors, Ms. Poole.

25 HEARING OFFICER FAY: Before we go

1 to -- staff, I noted in the transcript that staff
2 committed to a follow-up with DTSC regarding the
3 phase 2 soil study. What's the status of that?

4 MS. HOLMES: Is Mr. -- he just left.
5 The staff person who talked with DTSC just left
6 the room. I'm sure he will be back later on.
7 Let's have him update you at that time.

8 HEARING OFFICER FAY: Okay. Go ahead,
9 Ms. Poole, housekeeping --

10 MS. POOLE: Good morning. Housekeeping
11 issues, I think given what staff counsel has just
12 reported, we'll just wait and see what happens
13 today and address any concerns we have later on,
14 if that's all right.

15 HEARING OFFICER FAY: Okay. I'd like to
16 let everybody know that I have passed out a
17 revised exhibit list that takes us through exhibit
18 101. And please look it over when you have a
19 chance and give me feedback on any corrections
20 that you may have to the exhibit list.

21 MS. HOLMES: In between writing our six
22 briefs, is that correct, Hearing Officer?

23 HEARING OFFICER FAY: Yes, that's right.

24 MR. GALATI: Mr. Fay, if I can make one
25 comment regarding water.

1 HEARING OFFICER FAY: Now that I'm up to
2 six cases, myself, I'm a little less sympathetic.
3 Counselor.

4 MR. GALATI: I just wanted to make sure
5 that it was clear that CURE did meet their date in
6 filing their testimony. They had extended a time
7 for us to respond to their questions. And so I
8 didn't want to leave the impression that they had
9 surprised with testimony, that's number one.

10 We had gotten the testimony faxed to us.
11 We have experts that are prepared to deal with
12 that issue.

13 HEARING OFFICER FAY: Today?

14 MR. GALATI: Today. And we're ready to
15 go forward, and we think we can put that issue to
16 bed.

17 HEARING OFFICER FAY: Good.

18 MR. GALATI: Thank you.

19 HEARING OFFICER FAY: Great.

20 MS. POOLE: I appreciate that, Mr.
21 Galati.

22 PRESIDING MEMBER MOORE: Okay. All
23 right, here we go. Mr. Grattan, I'm going to turn
24 to you. You have a witness for water.

25 MR. GRATTAN: Yes, and I'm going to turn

1 this over to the very able counsel, Mr. Galati.

2 And gracious Mr. Galati.

3 MR. GALATI: I'm going to call back up
4 to the panel, they've been previously sworn, Ms.
5 Rogalla and Mr. Randy Marx. Ms. Rogalla
6 previously testified regarding the water resources
7 section of the water quality area. And Mr. Marx
8 will address the testing and the water quality.

9 I'd also like to make the Committee
10 aware that we do have another expert in a rebuttal
11 situation, if necessary, Mr. Richard Casagrande,
12 who is also an expert that can address any issues
13 that come up based on the testimony we hear.

14 PRESIDING MEMBER MOORE: Thank you. The
15 floor's yours.

16 Whereupon,

17 JOY ROGALLA and RANDALL MARX
18 were recalled as witnesses herein and having been
19 previously duly sworn, were examined and testified
20 as follows:

21 DIRECT EXAMINATION

22 BY MR. GALATI:

23 Q I'm going to go ahead and start with --
24 Ms. Rogalla previously stated her qualifications,
25 but I'd like to ask Mr. Marx to just briefly

1 describe his qualifications and experience for the
2 Committee.

3 MR. MARX: Okay, thanks. I'm with
4 Radian, I've been with Radian about 11 years now
5 in environmental consulting, working on hazardous
6 waste and various environmental projects.

7 Prior to that time I spent 11 years at
8 the CalEPA, approximately, the first five years at
9 state water resources control board here in
10 Sacramento, and the following six years at the
11 DTSC regional office in Sacramento.

12 And my job there was a first-line
13 supervisor in the REQRA permitting unit. And I
14 was in charge of a staff who was in charge of
15 making decisions on who required REQRA permitting
16 and hazardous waste determination issues and
17 closure plans and various issues related to REQRA.

18 MR. GALATI: Mr. Marx, you previously
19 sponsored, and I believe it was moved into
20 evidence as exhibit 93, the water resources
21 testimony of Joy Rogalla and Randall Marx, do you
22 remember that written testimony?

23 MR. MARX: Yes, I do.

24 MR. GALATI: And did you prepare the
25 portion of that written testimony or supervise its

1 preparation with respect to the water tests?

2 MR. MARX: Yes, um-hum.

3 MR. GALATI: And can you affirm that
4 testimony under oath today?

5 MR. MARX: Yes, I can.

6 MR. GALATI: And do you have any changes
7 or additions to that testimony?

8 MR. MARX: No.

9 MR. GALATI: I believe that the exhibits
10 you're sponsoring were previously moved into
11 evidence. I won't go there.

12 However, could you briefly summarize
13 your testimony with respect to the water tests,
14 specifically focusing on the sampling, where it
15 was taken and what the results were, for the
16 Committee?

17 MR. MARX: Sure, okay. I have sort of
18 an exhibit here, maybe help everybody kind of see
19 all these waste streams.

20 MR. GALATI: Yes, let me turn around a
21 microphone so you can make sure you're on the
22 record.

23 MR. MARX: Okay, again, I --

24 HEARING OFFICER FAY: Right. You'll
25 need to hold a microphone to be sure.

1 MR. MARX: Okay.

2 PRESIDING MEMBER MOORE: Ms. Poole, can
3 you see those? You're probably in a better
4 position to see them actually than we are.

5 MS. POOLE: I can, thanks.

6 MR. GALATI: And just for clarification,
7 this is a blow-up of a figure that is in exhibit
8 93 already attached to the written testimony.
9 It's figure W-1.

10 HEARING OFFICER FAY: Thank you.

11 MR. MARX: Yeah, this is a fairly
12 simplified drawing. There's a little more
13 detailed drawing, I guess, in the more recent
14 submittals that were made.

15 But what I really focused on was kind of
16 putting my DTSC hat back on and trying to figure
17 out if this is any hazardous waste streams
18 involved here.

19 And there's four streams that were
20 tested. The first one is called the oil field
21 produced water stream. And this is the waste
22 stream coming as produced water from the oil
23 fields. And this is after the various oil
24 removal, oil separation processes have occurred.

25 In hazardous waste perspective you want

1 to look at a material after it becomes a waste.
2 Prior to this time when oil is being removed by
3 the various oil separation processes, you're in
4 process because you're recovering oil, it still
5 has a use. But after those various oil separation
6 processes you do have a waste stream.

7 This is the first stream that was
8 tested. And, of course, at the TCI facility
9 there's two processes that occur to get the water
10 ready to be reused at Sunrise. And that is a
11 filtering process and a softening process. And
12 each of those processes produce a waste stream.

13 The filter process produces a backwash,
14 when the filters are backwashed. And a
15 regeneration brine is produced from the softening
16 process. Both those waste streams go to Valley
17 Waste.

18 And I'd note that also some of the oil
19 field produced water, after the oil separation
20 processes, also can directly go to Valley Waste.

21 So that's, let's see, that's one, two,
22 three. The fourth one is the softened boiler
23 feedwater which goes to Sunrise after those two,
24 the softening and the filter process.

25 So, I basically did what Diane did and

1 looked at the results. And it's my opinion that
2 all four of these streams are nonhazardous waste
3 streams, or nonhazardous streams.

4 And just to really briefly go over the
5 numbers, there were two rounds of sampling. The
6 first round of sampling in November '99 was
7 performed by Precision Analytical. And the
8 highest reading I found in any of those four
9 streams was a lead reading of 0.8 mg/liter, which
10 is six times less than the STLC of 5 mg/liter.

11 The highest organic reading was a
12 benzene reading of 46 mcg/liter, which is ten
13 times less than the TCLP of 500 mcg/liter.

14 And the second round of sampling was
15 done in December '99. And at that time an aquatic
16 bioassay test was also run, which is a DTSC test
17 which can also make something hazardous. And all
18 four streams easily passed that test.

19 The second round of sampling also had organic and
20 inorganic tests performed.

21 The highest readings there in the second
22 round, which was performed by Zalco Labs, a
23 different laboratory, was a benzene reading of 110
24 mcg/liter, which is five times less than the TCLP
25 of 500 mcg/liter. And a mercury reading of

1 0.25 mg/liter, which is 80 times less than the
2 TTLIC of 20 mg/liter.

3 So, I think my conclusion then is the
4 same as DTSC, that all four of these streams are
5 clearly nonhazardous.

6 PRESIDING MEMBER MOORE: Can you tell me
7 where those samples were taken? In other words,
8 did they take them with a sampling device of some
9 kind, on site --

10 MR. MARX: Yeah, I think their response
11 indicates the locations and the type of device
12 that they used.

13 PRESIDING MEMBER MOORE: I just want you
14 to --

15 MR. GALATI: I think at this time we can
16 go ahead and --

17 PRESIDING MEMBER MOORE: I just want you
18 to summarize where -- they were taken on site,
19 correct?

20 MR. MARX: They were all taken from
21 lines, these direct lines that either went to
22 Valley Waste or would go to Sunrise or at this
23 location.

24 PRESIDING MEMBER MOORE: So they open a
25 stop-cock in those and bleed out a sample?

1 MR. MARX: Yeah, they let it run for, I
2 think, five minutes to try to get a representative
3 sample; and take the sample in the appropriate
4 container depending on the type of analysis,
5 plastic or whatever's appropriate for that
6 particular analysis.

7 PRESIDING MEMBER MOORE: Just out of
8 curiosity, what happens to the material, the
9 liquids that run for five minutes? Do they take
10 those and take them in a separate container?

11 MR. MARX: Oh, I imagine they just put
12 them back into the process, but I'm not certain.

13 PRESIDING MEMBER MOORE: Thank you.

14 MR. MARX: Shall I leave this up or --

15 HEARING OFFICER FAY: Could you leave
16 that figure up, please, because --

17 MR. MARX: Sure.

18 HEARING OFFICER FAY: -- it may come in
19 handy later.

20 MR. MARX: Okay.

21 HEARING OFFICER FAY: That's figure W-1,
22 and you say that is found in exhibit 93, Mr.
23 Galati?

24 MR. GALATI: Yes, that is.

25 HEARING OFFICER FAY: Okay.

1 MR. GALATI: And, Mr. Fay, at this time
2 I'd like to mark for identification a submittal
3 entitled Sunrise Cogeneration and Power Project,
4 response to CURE questions, dated January 14,
5 2000. The document, itself, is dated January 21,
6 1999, and was docketed on January 22, -- excuse
7 me, 2000.

8 HEARING OFFICER FAY: That will be
9 exhibit 102.

10 BY MR. GALATI:

11 Q Mr. Marx, in exhibit 102 there's an
12 attachment A I've just put in front of you. Could
13 you please turn to it. Are you familiar with that
14 diagram?

15 A Um-hum.

16 Q And could you briefly describe what that
17 diagram is?

18 A This is a little bit, basically a more
19 detailed version of what's up here that shows some
20 of the oil separation processes prior to the
21 filtration and the softening processes.

22 Q And, Mr. Marx, did you review the
23 testimony filed by Dr. Page?

24 A Yes, I did, um-hum.

25 Q And one of the contentions was that

1 Dr. Page had testified in previously written
2 testimony that the produced water stream that was
3 tested by TCI was not, in fact, representative of
4 the produced water. Do you recall that?

5 A Yes, um-hum.

6 Q Could you -- do you have any comments
7 regarding that conclusion?

8 A You're talking about the produced water
9 stream?

10 Q Yes.

11 A Well, again, from my DTSC experience
12 you're really concerned with the material after it
13 becomes a waste, not in the middle of the process.
14 So it's important to distinguish between when
15 you're in a process and when you're out of the
16 process where the material has no useful purpose
17 anymore.

18 And while you're in the oil/water
19 separation phase the TCI is doing something
20 useful, they're recovering oil from a stream. So
21 you haven't produced a waste that has no useful
22 purpose until after that time. So that's when
23 you'd be interested in taking samples to see if
24 the waste is hazardous or not.

25 Q And do you have an opinion on the sample

1 of the produced water after it had gone through
2 some processing, whether that is representative of
3 the potential waste stream?

4 A From reading all the various testimony
5 of the sampling techniques that occurred it
6 appears that representative samples were taken.

7 Q And with respect to produced water, does
8 it always, after it is processed and the oil is
9 taken out of it, is it always sent directly to
10 Valley Waste?

11 A I'm sorry, after the?

12 Q After the produced water, the oil is
13 taken out of it, is all of the produced water sent
14 to Valley Waste?

15 A Well, it's going to be going to Sunrise
16 after the filtration and softening process.

17 Q Would it be fair to characterize that
18 TCI performed tests on the produced water prior to
19 softening?

20 A Yes, um-hum.

21 Q And did TCI also perform tests on the
22 produced water after softening?

23 A Yes, um-hum.

24 Q And that was nonhazardous?

25 A That's correct.

1 Q Do you have an opinion on whether that
2 water is a waste?

3 A Well, when it's going to Sunrise it's a
4 waste, but it's being recycled because it has a
5 purpose use at Sunrise. So it needs to follow
6 the, it would have to follow the requirements for
7 DTSC as a recycled waste.

8 Q And the waste stream that you identified
9 as regeneration brine, I believe?

10 A Um-hum.

11 Q Could you briefly describe for the
12 Committee what that is?

13 A Well, that's within the softening
14 process and as the softeners absorb the various
15 metals, at a certain point it needs to be
16 regenerated, because they've been saturated,
17 basically with the metals.

18 And so a regeneration liquid is run
19 through there to sort of regenerate the softeners
20 again so they can work. That produces a brine
21 waste stream.

22 Q Did you review Dr. Page's testimony
23 regarding his opinion on the tests that were
24 performed on the regeneration brine stream?

25 A Yes, I did, um-hum.

1 Q And did he agree with the test results?

2 A No. There was some indication there
3 that maybe the samples that were taken were not
4 representative. And there was a calculation
5 involving a 64 number, I think, that indicated
6 that he'd expect to have higher numbers there.

7 And there was a discussion of the fact
8 that some of the numbers went up over the process
9 where he'd expect them to drop.

10 I think, again from my DTSC experience,
11 that we prefer to look at data that is actual
12 waste stream data and not calculations of
13 estimates of what something might be. We would
14 never, at DTSC, accept a calculation on a
15 hypothetical concentration. We would prefer to
16 focus on an actual concentration.

17 Q And Dr. Page came up with an expected
18 concentration factor of 64, is that correct?

19 A Yes, um-hum.

20 Q Okay, and does that mean that the
21 regeneration brine should have 64 times the
22 concentration of metals, for example, than the
23 inlet to the softener?

24 A Well, again, there's a lot of various
25 assumptions that went into that, and I don't know

1 if you can be so precise to come up with an actual
2 number. There's reason to think it might be, you
3 know, you have dilution that is occurring during
4 that process where you have more water that would
5 be mixed in with the brine, so the factor might
6 not be at that particular number.

7 But I think really the main point is
8 that you want to focus on what the concentration
9 was in the actual waste stream that's going to
10 Valley Waste, or to Sunrise, not in a hypothetical
11 calculation that is derived from that kind of
12 technique.

13 Q Assuming that there is a 64 times
14 concentration, would that change your opinion on
15 whether the regeneration brine stream is a
16 hazardous waste?

17 A No. Because even if you assume that 64
18 was fact, and you multiplied all the analytical
19 results by 64, you'd still be far less than the
20 TTLCs. I think you had one or two that were just
21 slightly over the STLCs, but again, you have to
22 run the STLC test to verify that, you're below
23 that.

24 And in my opinion, even if you
25 multiplied everything by 64 you'd still be well

1 under hazardous waste levels.

2 Q So assuming Dr. Page's prediction was
3 correct that there should be 64 concentration, do
4 you believe that with the inlet test results and
5 the other test results you reviewed, that there's
6 no hazardous waste associated with softening of
7 produced water for the Sunrise project?

8 A Yes, I do. And I think the key point is
9 there if you get -- you starting getting close to
10 the haz waste limits, then you really have to look
11 at the sampling technique and whether it was a
12 perfectly representative sample in a lot of
13 detail.

14 But when you're so far below the levels
15 like these data indicate, then I would agree with
16 DTSC that there's no need to run additional tests
17 or do different analyses.

18 Q In your experience has DTSC ever made a
19 determination on a calculated or predicted number?

20 A Not when I was there, I don't believe
21 so, no. You always fall back on actual results
22 unless there's a certain reason why you can't get
23 that. Almost always you should be able to get
24 actual results, and not predicted values.

25 Q And these samples were done on two

1 different days, over a month apart?

2 A Yes, um-hum, by two different labs.

3 Q And actually was the aquatic bioassay
4 done by a different lab?

5 A You're right, three different labs, um-
6 hum.

7 Q And all of those laboratories, to your
8 knowledge, are state certified?

9 A Yes.

10 Q So, based on that do you believe that
11 the Sunrise project will comply with all
12 applicable LORS if approved by the Commission?

13 A As far as the DTSC hazardous waste
14 regulations and laws, it doesn't appear to be a
15 generator of hazardous waste that would require
16 meeting any DTSC Title 22 regulations, that's
17 correct.

18 Q And do you believe that the use of
19 softened produced water or the creation of
20 softened produced water will have any significant
21 adverse environmental impacts?

22 A No.

23 MR. GALATI: I have no further
24 questions. The panel is available for cross.

25 PRESIDING MEMBER MOORE: Counselor, I

1 have a question for your witness, and that is on
2 the -- with regard to the 64 times number that
3 you've referred to several times, and the fact
4 that several laboratories have looked at this
5 data, what's the range of variance on the figures
6 from the field sample between those different
7 labs? How close are they?

8 MR. MARX: For which particular sample
9 result?

10 PRESIDING MEMBER MOORE: For the --

11 MR. MARX: I believe they're in the same
12 range in general. Each is a little different. I
13 think the numbers are all so low that when you're
14 comparing two very low numbers it's one might be
15 higher in one case and vice versa.

16 But I don't believe either the first or
17 the second one had a significantly higher or lower
18 result.

19 PRESIDING MEMBER MOORE: So you didn't
20 go back and look at the samples and look at how
21 close the samples were to each other? In other
22 words, what the range was?

23 MR. MARX: Yes, I looked at that, but I
24 don't recall for every single anilide what the
25 exact difference was. We could run through it, we

1 have the data here. But I didn't see anything
2 that was significantly out of whack in terms of
3 one set being different from the other set

4 PRESIDING MEMBER MOORE: If you'd seen a
5 number that was as high as we've had stated in
6 this document sent to you, would that raise a flag
7 in your mind? If one of these numbers showed up
8 in a sample, would that raise a flag?

9 MR. MARX: If one of the numbers was --

10 PRESIDING MEMBER MOORE: I need to cite
11 this. This is a letter that I've received signed
12 of Bonnie Heeley. It's docketed 98-AFC-4, date
13 received January 27th.

14 HEARING OFFICER FAY: Testimony of Bruce
15 W. Page.

16 PRESIDING MEMBER MOORE: I'm sorry, it
17 is the testimony of Bruce W. Page, Ph.D., on
18 behalf of the California Unions for Reliable
19 Energy on the water sampling results.

20 If you saw the numbers that Dr. Page has
21 concluded in here, would they raise a flag in your
22 mind in the field sample?

23 MR. MARX: Only if you were really
24 approaching the hazardous waste levels. If one of
25 the results was, say, within 10 or 20 percent of

1 the hazardous waste levels and the other one was
2 much below I'd start to be concerned.

3 But when both numbers, even if they
4 differ, are both orders of magnitude below the
5 hazardous waste levels, then I would not be
6 concerned.

7 PRESIDING MEMBER MOORE: Thank you.

8 Okay, then, staff.

9 MS. HOLMES: We have no questions of
10 these witnesses.

11 HEARING OFFICER FAY: Okay. CURE.

12 MS. POOLE: A few questions for Mr.
13 Marx.

14 CROSS-EXAMINATION

15 BY MS. POOLE:

16 Q Mr. Marx, based on your experience at
17 DTSC, is DTSC concerned about facilities that
18 treat hazardous waste?

19 A Yes, they are.

20 Q Does DTSC, in fact, have authority to
21 permit facilities that treat hazardous waste?

22 A Yes, they do.

23 Q Do you know whether Valley Waste accepts
24 produced water from the oil field for disposal?

25 A Directly from the oil fields? Yes, they

1 do. Various waste streams from the oil fields,
2 it's quite a wide range, I think, in their permit.

3 Q Thank you. And you referred, I believe,
4 today in your testimony to early treatment
5 processes within the overall Texaco treatment
6 facility.

7 Where does the oil go from those early
8 treatment steps?

9 A I believe it has value, it's used, you
10 know, it's recovered and used as product by
11 Texaco. And that's real important, because that's
12 what keeps them in the process as opposed to the
13 waste arena.

14 Q To your knowledge that oil is used as
15 product?

16 A I believe so.

17 MS. POOLE: Thank you, that's all my
18 questions.

19 HEARING OFFICER FAY: Okay, --

20 PRESIDING MEMBER MOORE: Staff, do you
21 have a witness?

22 HEARING OFFICER FAY: Just have --

23 MS. HOLMES: No.

24 PRESIDING MEMBER MOORE: Oh, I'm sorry,
25 Mr. Fay has --

1 EXAMINATION

2 BY HEARING OFFICER FAY:

3 Q I just have one. Mr. Marx, have you had
4 occasion in your experience to take the kind of
5 samples that were taken by these labs?

6 A Physically, in the field?

7 Q Yes.

8 A Not that much. I was more involved with
9 permitting and the paperwork side of it as opposed
10 to we usually have technicians that would do that.
11 Or actually, DTSC did very little sampling on our
12 own, other than the enforcement staff. And I
13 wasn't in enforcement. I was in permitting, REQRA
14 permitting.

15 Q And how does DTSC verify, based on your
16 experience, how did they verify that a sample was
17 taken at the appropriate location --

18 A Well, first of all, --

19 Q -- in a waste stream?

20 A -- by certifying the laboratories. They
21 have a lab certification process. Secondly,
22 there's chemists that work at DTSC that mull over
23 the data to make sure proper procedures were
24 followed and all the chain of custody and QAQC
25 type procedures were followed.

1 So I would tend to rely on the opinion
2 of those chemists in helping reach a decision.

3 HEARING OFFICER FAY: All right, thank
4 you.

5 MR. GALATI: Just one redirect.

6 HEARING OFFICER FAY: Yes.

7 REDIRECT EXAMINATION

8 BY MR. GALATI:

9 Q Counsel for CURE asked you a question
10 about produced water. Do you recall that?

11 A Yes.

12 Q I think specifically whether produced
13 water from the oil field goes to Valley Waste. Is
14 the term produced water a catch-all term for any
15 water that comes out of the ground with oil?

16 A Yeah, I believe it's a fairly generic
17 term.

18 Q And so the produced water may not go
19 directly from the oil well to Valley Waste,
20 correct?

21 A Yes.

22 Q And you're referring, when you talk
23 about produced water, to the produced water that
24 could be a waste stream from the TCI 2-22
25 facility?

1 A Yes, my focus was on, again, from the
2 waste perspective, when it first becomes a waste,
3 and I believe that's after the oil separation
4 processes and prior to filtering and softening.

5 Q And again, to clarify, the produced
6 water prior to that stage, was it your opinion
7 that that was not a waste?

8 A Yes, I believe that's part of the
9 process.

10 MR. GALATI: Thank you, no further
11 questions.

12 HEARING OFFICER FAY: Any redirect?

13 MS. HOLMES: No redirect.

14 HEARING OFFICER FAY: Thank you. Do you
15 have any other witnesses on this matter?

16 MR. GALATI: I have a witness that may
17 rebut what we hear today.

18 HEARING OFFICER FAY: Okay, fine. Then,
19 staff, do you have any testimony on this?

20 MS. HOLMES: No, we do not.

21 HEARING OFFICER FAY: Okay. CURE?

22 MS. POOLE: Yes. I'd like to present
23 Dr. Page and Dr. Fox as a panel.

24 HEARING OFFICER FAY: Dr. Fox has
25 previously been sworn and is still under oath.

1 Would the court reporter please swear Dr. Page.

2 Whereupon,

3 PHYLLIS FOX

4 was recalled as a witness herein and, having been
5 previously duly sworn, was examined and testified
6 further as follows:

7 Whereupon,

8 BRUCE PAGE

9 was called as a witness herein and after first
10 being duly sworn, was examined and testified as
11 follows:

12 MS. POOLE: I think it might be helpful
13 if we mark some exhibits before we begin.

14 HEARING OFFICER FAY: All right.

15 MR. GALATI: I'm sorry, can I interrupt?
16 Can I move in the exhibit, I believe it was marked
17 103.

18 HEARING OFFICER FAY: 102?

19 MR. GALATI: 102.

20 HEARING OFFICER FAY: Any objection?

21 MS. POOLE: No objection.

22 HEARING OFFICER FAY: All right, so
23 moved.

24 What are your exhibits, Ms. Poole?

25 MS. POOLE: The first, which we will not

1 discuss today, but which has been filed is the
2 testimony of Dr. Fox on water quality impacts of
3 the project, dated January 3, 2000.

4 HEARING OFFICER FAY: That's exhibit
5 103.

6 MS. POOLE: The second is the testimony
7 of Dr. Page on water sampling results dated
8 January 26, 2000.

9 HEARING OFFICER FAY: Dr. Page's
10 testimony is exhibit 104.

11 MS. POOLE: And the final is Dr. Fox's
12 testimony on the water sampling results also dated
13 January 26th.

14 HEARING OFFICER FAY: That will be
15 exhibit 105.

16 DIRECT EXAMINATION

17 BY MS. POOLE:

18 Q Dr. Page, would you please briefly
19 identify yourself and your occupation for the
20 record?

21 A Yes. My name is Bruce W. Page. I live
22 in El Cerrito. My occupation is I'm a chemical
23 engineer who works in the environmental field. I
24 have my doctorate from the University of
25 California at Berkeley 1971.

1 Q And your testimony dated January 26th
2 which has been marked as exhibit 104, was that
3 prepared by you and under your direction?

4 A Yes, it was.

5 PRESIDING MEMBER MOORE: Excuse me,
6 could we just move that other microphone?

7 HEARING OFFICER FAY: Please speak
8 directly into the mike. If you are facing counsel
9 you'll be facing away from the mike. The mike is
10 highly directional, so perhaps move it around in
11 front of you.

12 BY MS. POOLE:

13 Q And does that testimony marked exhibit
14 104, are those factual statements contained in
15 that testimony true and accurate to the best of
16 your belief?

17 A Yes, they are.

18 Q And are any opinions contained in that
19 testimony based on your best professional
20 judgment?

21 A Yes, they are.

22 Q Thank you.

23 DIRECT EXAMINATION

24 BY MS. POOLE:

25 Q Dr. Fox, would you please state your

1 name for the record?

2 A Phyllis Fox.

3 Q I don't think we need to go through your
4 qualifications.

5 And have the exhibits which have been
6 identified as exhibits 103 and 105, were those
7 prepared by you or under your direction?

8 A They were.

9 Q And do the factual statements contained
10 therein, are those true and accurate to the best
11 of your knowledge?

12 A They are.

13 Q And do any opinions contained therein
14 represent your best professional judgment?

15 A Yes.

16 MS. POOLE: I would like to ask Dr. Fox
17 to just briefly summarize the testimony and what
18 we would like to do is put on the overhead what
19 has been identified as attachment A to exhibit
20 102.

21 (Pause.)

22 DR. FOX: Okay, I'd like to start out
23 with the applicant's figure W-1, the water block
24 flow diagram which Mr. Marx talked about a minute
25 ago.

1 The figure that I have on the screen
2 here, which is station 2-22, proposed new water
3 plant process flow diagram. That is an expansion
4 of the information that is in this block on the
5 applicant's figure. The block on the applicant's
6 figure is labeled TCI2-22 facility.

7 Well, there's a lot of stuff that goes
8 on within this facility. And that stuff is
9 expanded on the overhead that I have put up.

10 Okay, I'd like to just briefly run
11 through the treatment steps in the Texaco station
12 2-22 treatment process. It starts in the upper
13 left-hand corner here, there's a box that reads
14 produced water from oil/water separation unit.

15 So there's another treatment step on
16 here that's not even shown. What happens is
17 produced water from the oil field comes into the
18 facility. It goes through an oil/water separator,
19 which is a standard device that you find in
20 petroleum operations that separates oil and water.

21 After it goes through the oil/water
22 separation unit some of the water is stored in raw
23 water tanks and oil is skimmed off. The water
24 then moves down into a series of cylindrical
25 shaped units more or less in the middle of the

1 figure labeled flotation cells.

2 The flotation cells are dissolved air
3 flotation units. And that, again, is a standard
4 treatment process that you find in the petroleum
5 industry. What it is, is basically a bubbler.
6 Air bubbles are blown through the water, the
7 rising air bubbles entrain oil and cause it to
8 rise to the surface. The oil is then skimmed off.

9 After the water goes through the
10 flotation cells, it then moves down into the next
11 three sets of cylindrical devices shown on this
12 figured labeled filters. That's these three units
13 here.

14 The filters are a pre-treatment step for
15 the downstream ion exchange unit. And the purpose
16 of the filters is to remove solids which would
17 plug up and adversely affect the ion exchange
18 resin.

19 After the water goes through the filters
20 it then enters the ion exchange units which are
21 the next three series of cylindrical units on this
22 figure labeled softeners. Softeners and ion
23 exchange unit are analogous, it means the same
24 thing.

25 After the water goes through the

1 softeners it then heads out here to the right,
2 softwater to backbone, that would be the water
3 that goes into the TNAP corridor and ultimate ends
4 up at the Sunrise plant as feedwater for the HRSG.

5 There are a number of water tanks here
6 where the waste streams are collected. The
7 filters, the backwash, the filters get clogged
8 with suspended material that's removed from the
9 water, and they have to be backwashed periodically
10 to clean them. The filter backwash water is
11 collected in a tank which is sent to Valley Waste.

12 Likewise, the ion exchange unit or the
13 softener has to be regenerated periodically. An
14 ion exchange system is a resin which exchanges
15 atoms on the resin for ions in the incoming
16 stream. And this particular system is designed to
17 move cationic materials, calcium and magnesium
18 primarily. However, it also removes other type
19 cationic materials like copper, chromium, barium,
20 lead, nickel and zinc.

21 So any of those elements that are in the
22 feedwater to the ion exchange system end up on the
23 ion exchange resin. And when all of the sites on
24 the ion exchange resin are filled up, you have to
25 regenerate it to remove those contaminants so you

1 can use it again to take the calcium and the
2 magnesium out of the water.

3 Well, the regeneration step you use a
4 brine solution, about 10 percent sodium chloride,
5 and you run it through the resins. You take the
6 resins offline and you run this brine through
7 them, and the brine washes off the contaminants
8 that were captured on the resin. And that brine
9 stream goes in the tanks and is periodically sent
10 to Valley Waste.

11 So you've got two waste streams here,
12 the filter backwash and the brine regenerant.

13 Now, in the sampling that the applicant
14 did they collected samples roughly at this point
15 where I'm putting an X, which is the inlet to the
16 ion exchange process. They also collected a
17 sample at the outlet of the ion exchange unit
18 roughly at this point where the arrow labeled 7 is
19 pointing.

20 They also collected a sample of
21 regeneration brine which they collected on this
22 line here, which I'm placing an X on, which is
23 labeled regeneration brine.

24 And finally, they collected a sample of
25 filter backwash on this line labeled filter

1 backwash where I'll place another X. So we have
2 four X's now.

3 The first thing I want you to notice is
4 that all of these X's are very far down in the
5 treatment process. No samples were taken upstream
6 of where these X's are. And in particular, no
7 samples were taken of the produced water coming
8 into the plant in the upper left-hand corner where
9 I just placed an X and marked it A.

10 HEARING OFFICER FAY: Dr. Fox, let me
11 interrupt you a minute. Could you please describe
12 the location of the first X that you indicated as
13 a sampling location?

14 DR. FOX: The first X is at a location,
15 there's a box labeled fresh water makeup, and an
16 arrow comes out of that box and points to a line.
17 And the sample of the inlet was collected
18 immediately downstream of where that fresh water
19 makeup comes into the inlet line to the softeners.

20 MR. GALATI: Mr. Fay, I have extra
21 copies of that if you'd like.

22 HEARING OFFICER FAY: That would be
23 helpful.

24 (Pause.)

25 HEARING OFFICER FAY: Okay, go ahead.

1 Sorry.

2 DR. FOX: Okay, so the first sample at
3 the inlet was taken immediately downstream of the
4 point where freshwater makeup is added. And
5 that's the sample that I'll be referring to as
6 inlet.

7 The second sample was taken where the
8 arrow labeled 7 points to the softwater to
9 backbone line, let's call that B.

10 The third sample was taken on the
11 regeneration brine line, which I'll call C. And
12 the last sample was taken on the filter backwash
13 line which I'll label D.

14 So there were basically four samples
15 collected and all four of the samples were
16 collected very far down in the treatment process.
17 There were no samples collected of produced water
18 coming into the plant in the upper left-hand
19 corner of this figure.

20 Now, I'd like to talk a bit about the
21 softener, since three of the samples were
22 collected around the softener. And to do that I
23 need the next figure.

24 MS. POOLE: I do have copies of this.
25 This is also taken from exhibit 102.

1 HEARING OFFICER FAY: Can you describe
2 where in the exhibit?

3 MS. POOLE: This is a summary of the
4 data -- I'm sorry, it's not exhibit 102, this is a
5 summary of the data that was provided in the data
6 responses to staff's data request.

7 HEARING OFFICER FAY: Does this appear
8 exactly this way in the record?

9 MS. POOLE: These numbers appear in the
10 record. This table is a condensation of the
11 numbers.

12 HEARING OFFICER FAY: All right, let's
13 mark this as an exhibit. The table titled
14 November 15, 1999 samples with five columns, four
15 figures and the far-left column of chemicals will
16 be exhibit 106.

17 DR. FOX: Okay. I've summarized seven
18 cationic metals here, which are the ones that you
19 would expect to be removed by the type of resin
20 that is used in this ion exchange system. And as
21 you will recall I told you that an ion exchange
22 system is nothing more than a cylinder that's
23 packed with resin, and the resin looks like of
24 like sand.

25 And these metals that are in the inlet,

1 which is the first column of numbers, would be
2 expected to be removed by the ion exchange unit.
3 In other words, you'd expect some of these metals
4 to deposit on the ion exchange resin so that the
5 concentration of these metals in the outlet from
6 the ion exchange unit should be smaller than the
7 concentration in the inlet. Because that's just
8 how an ion exchange system looks.

9 And you can look at these two columns
10 and compare them and see that that's not the case.
11 In the case of barium you had .2 mg/liter going
12 in, and .3 coming out. It's physically impossible
13 to create more barium across the ion exchange
14 system.

15 In the case of cadmium you had .002
16 going in, and .008 coming out, four times more.
17 In the case of chromium nothing was detected going
18 in; .02 was detected coming out. Copper looks
19 reasonable. You see a reduction across the resin
20 and that makes sense, that's what you would
21 expect.

22 Lead, you see nothing going in, and .8
23 coming out. That's a fourfold concentration
24 factor across the ion exchange resin. Nickel, .3
25 going in, .04 coming out. And zinc, again, that's

1 reasonable, .08 going in, .03 coming out, you see
2 some reduction.

3 So for quite a few of these metals you
4 have the curious situation of having higher
5 concentrations in the outlet stream than you had
6 in the inlet stream.

7 The other problem with this data is the
8 brine column, the third column of numbers labeled
9 brine, is the brine regeneration stream that I
10 talked about. And as I explained in the ion
11 exchange process, you end up depositing calcium,
12 magnesium and these metals on the resin, you fill
13 up all the resin sites.

14 And you have to periodically cleanse the
15 resin by backwashing it with brine. And that's
16 called the brine stream or brine regeneration.
17 And that's done with a small flow of water. You
18 don't want to waste a lot of water regenerating
19 the brine.

20 So there's typically a concentration
21 factor between the inlet and the brine. You would
22 expect anywhere from 10 all the way up to 100 fold
23 concentration of metals in the brine compared to
24 the inlet.

25 So if you compare the brine column with

1 the inlet column what you should see is much
2 higher concentrations in the brine than in the
3 inlet.

4 MR. GALATI: And I would just like to
5 lodge an objection at this point in the use of the
6 term 100. The previously filed written testimony
7 said there was a concentration factor of 10, and
8 then there was a calculated concentration factor
9 of 64. No one has mentioned a concentration
10 factor of 100 until this moment.

11 MS. POOLE: Dr. Fox is testifying based
12 on her experience with these systems. And she
13 said that these types of systems run up to 100.

14 MR. GALATI: And why was that not in her
15 written testimony?

16 HEARING OFFICER FAY: We're going to
17 overrule the objection for now, and just continue.
18 I think this is background and counsel will have
19 an opportunity to rebut.

20 DR. FOX: I'll just amplify on the
21 concentration factor a bit. I initially
22 calculated a concentration factor of 10 with
23 virtually no information.

24 I then got a design estimate from a
25 vendor based on some preliminary produced water

1 composition data that Texaco had provided in
2 response to a data request. The vendor came up
3 with a concentration factor of 15.

4 And then this past week, in response to
5 detailed information provided by Texaco on the
6 design of this specific system, Dr. Page
7 calculated what the concentration factor actually
8 was for this system. And Mr. Galati is correct,
9 it is 64 for this system.

10 But when I made that statement I was
11 speaking in general for ion exchange systems in
12 general.

13 Anyway, for this specific case, and
14 these samples are for Texaco's 2-22 treatment
15 plant, you would expect the concentrations in that
16 brine column to be 64 times the concentrations in
17 the inlet stream which is the first column of
18 numbers.

19 And you can look and compare the numbers
20 and see very quickly that that's not the case.
21 And in fact, in many cases you find the
22 concentration in the brine is lower than the
23 concentration in the inlet.

24 For example, copper, .009 mg/liter in
25 the brine, .02 at the inlet. That's physically

1 impossible. Likewise zinc, .04 in the brine, two
2 times higher at the inlet. You'd never see higher
3 concentrations at the inlet than in the brine
4 unless the samples were collected very early in
5 the regeneration process, before any of the metals
6 had been stripped off of the resin, or very late
7 in the process after all the metals had been
8 removed.

9 And therefore, these are not
10 representative samples. What should have happened
11 is samples should have been collected from some of
12 these tanks that were shown on the detailed flow
13 diagram that I talked about earlier, the brine
14 stream and the backwash stream go into tanks where
15 they're held. And then they are sent to Valley
16 Waste.

17 In order to get a representative sample
18 you should collect the entire stream from the
19 brine regeneration process. Or, alternatively,
20 you should use some type of time integrated
21 composite sampling process. There are standard
22 composite samplers that collect the small aliquot
23 every half hour or every hour, depending on how
24 you program the system, so you can get a sample
25 that's representative of the entire sample for the

1 entire process.

2 What you have here are instantaneous
3 grab samples. And it's not even clear to me that
4 for example the parcel of water that was sampled
5 at the inlet is the same parcel of water that was
6 being sampled at the outlet.

7 And that's one of the problems that
8 arise from instantaneous grab sampling in this
9 kind of a dynamic system.

10 I think that's all I have to say about
11 these.

12 BY MS. POOLE:

13 Q Dr. Page, a couple of quick questions
14 for you. I believe it's on page 2 of your
15 testimony under Roman numeral III, second
16 paragraph down, you refer to the term
17 breakthrough. Can you explain what this term
18 means.

19 DR. PAGE: The ion exchange process that
20 we're talking about is designed primarily to
21 remove hardness from the water before it goes into
22 the heat recovery systems.

23 And the way that process works is that
24 the resin, the ion exchange resin is saturated
25 with sodium ions and under the conditions of the

1 feed of the service step, the resin prefers the
2 hardness ions to the sodium, so an exchange takes
3 place that the hardness ions go onto the resin,
4 the sodium comes off the resin.

5 However, the resin only has a limited
6 capacity. And once that capacity comes to an end,
7 that exchange process can no longer continue.
8 There's no more sodium left on the resin to
9 exchange, so the hardness ions begin to come out
10 in the water, in the effluent water, and that's
11 called break-through.

12 MS. POOLE: Thank you. Whether the
13 process is operating before or after break-
14 through, should metal levels in the outlet stream
15 from an ion exchange process be higher than in the
16 inlet stream?

17 DR. PAGE: No, they should not.

18 MS. POOLE: And when would you expect
19 regeneration brine samples to show lower levels of
20 metals than in the inlet stream?

21 DR. PAGE: I would agree with what Dr.
22 Fox said, either at the very beginning of the
23 process, before the -- let me explain the break-
24 through process -- or the regeneration process
25 just a little bit more.

1 The concentrations change very very
2 rapidly in the effluent water from the
3 regeneration step. In a relatively small volume
4 of water you're knocking off all those ions that
5 you collected during the long service step.

6 And so everything happens very very
7 fast. First of all, the water has very little in
8 it, and then the concentrations begin to rise very
9 rapidly. Once you've kicked off all the ions,
10 left sodium on the resin, that process comes to an
11 end, and the concentrations drop very rapidly.

12 So either very early in the process or
13 very late in the process you would expect to see
14 low metals concentrations.

15 MS. POOLE: Thank you. Dr. Fox put up a
16 table of sampling results which has been marked as
17 exhibit 106. These numbers are numbers like .002
18 mg/liter. Is there equipment available that can
19 accurately detect these levels of metals?

20 DR. PAGE: Yes.

21 MS. POOLE: And would you expect a
22 reputable lab to be off in measuring these metals
23 by as much as a factor of 4?

24 DR. PAGE: Definitely not.

25 MS. POOLE: And would you like to add

1 anything to Dr. Fox's discussion in response to
2 the remarks made by Mr. Marx?

3 DR. PAGE: No. I think the response she
4 gave would be the same thing I would say.

5 MS. POOLE: Okay, thank you. And, Dr.
6 Fox, did you want to respond to any points made by
7 Mr. Marx?

8 DR. FOX: I did. I just wanted to make
9 a comment on Mr. Marx's comments about comparing
10 quote, hypothetical concentrations to regulatory
11 levels.

12 In my supplemental water testimony I
13 made some calculations based on the data that was
14 provided in an attempt to figure out what the
15 concentrations might reasonably be expected to be
16 in the brine regeneration stream and in the
17 produced water at the front-end of the treatment
18 process.

19 And the reason I did that is because the
20 samples that were provided were not adequate to
21 make a determination of whether or not the Texaco
22 system is treating hazardous waste.

23 I specifically took the outlet lead
24 concentration of .8 mg/liter. Since you've got .8
25 in the outlet, clearly you're going to have .8 in

1 the inlet, and likely more because lead is removed
2 across the resin. And then I multiplied that by
3 Mr. Page's 64 full concentration factor. And
4 found that the resulting concentration would
5 exceed the regulatory levels for lead and result
6 in the classification of the brine stream as a
7 hazardous waste had the samples that were provided
8 been representative.

9 Likewise, I took the benzene
10 concentrations at the inlet to the ion exchange
11 system and I back-calculated what the benzene
12 concentration might have been in the produced
13 water coming into the treatment system.

14 And what I found in that case was the
15 concentrations would have exceeded the regulatory
16 level for benzene, which is .5 mg/liter.

17 I was forced to make those hypothetical
18 calculations because the data that was provided
19 was not adequate.

20 MS. POOLE: The witnesses are available
21 for cross.

22 HEARING OFFICER FAY: All right, Mr.
23 Galati.

24 MR. GALATI: Thank you. Turn to Dr. Fox
25 first.

1 CROSS-EXAMINATION

2 BY MR. GALATI:

3 Q Let me start with what you just said
4 about lead. You said you took the outlet sample
5 of .8, multiplied it by a concentration of 64?

6 A Correct.

7 Q That exceeded regulatory levels?

8 A Yes.

9 Q Isn't it true that there are two
10 regulatory levels? The TTLC and the STLC?

11 A Correct.

12 Q And isn't the TTLC the total threshold
13 limit concentration?

14 A Correct.

15 Q And when you look at the total threshold
16 limit concentration you compare a particular type
17 of test, is that correct?

18 A Yes, but in this case the .8 mg/liter
19 was done according to the STLC test, so I compared
20 it to the proper limit.

21 Q Would it surprise you these are
22 unfiltered samples?

23 A Not according to the methods that are
24 written on the bottom of the page.

25 Q Are you familiar with the test on

1 mercury on 12/28?

2 A Cold vapor, yes.

3 Q I'm sorry, on 12/28/99 there was a test
4 run by Zalco Labs on the constituent mercury.

5 A Yes.

6 Q Okay. And a TTLC test was done on that
7 sample, correct?

8 A Yes. Zalco used different methods than
9 Precision Analytical, which analyzed the November
10 15th data. Zalco actually did total analyses and
11 compared them to TTLCs, Test TLCs, and then when
12 they found an exceedence they used the wet method
13 and calculated the soluble concentrations.

14 Q Let's move on to something else while my
15 experts are looking at that.

16 Dr. Fox, do you contend that water mixed
17 with oil in the ground is a waste? Talking about
18 water mixed with oil in the ground.

19 MS. POOLE: Dr. Fox isn't testifying to
20 water mixed with oil in the ground.

21 MR. GALATI: My offer of proof is I'd
22 like to find out at what point in time in the
23 process that she has just described she would
24 characterize this produced water as a waste.

25 HEARING OFFICER FAY: We'll allow the

1 question.

2 DR. FOX: I think that calls for a legal
3 opinion.

4 BY MR. GALATI:

5 Q Okay, can you answer the question
6 whether or not crude oil that has been pumped into
7 a tank that contains water that any constituent in
8 that tank or any portion of that mixture is waste?

9 MS. POOLE: Can you repeat that
10 question? I don't understand it. Do you?

11 DR. FOX: I understand it, but --

12 HEARING OFFICER FAY: Mr. Galati, why
13 don't you describe for us where you're going with
14 this and what you're trying to determine.

15 MR. GALATI: I'd be glad to because it
16 would probably take awhile.

17 Dr. Fox had testified that she
18 calculated prior, for example with the
19 concentrations of benzene, prior to this
20 treatment. She also testified there's quite a bit
21 of treatment that went on before the test results.

22 Our expert had testified it doesn't
23 become a waste until after some of that treatment
24 is taking place.

25 She is comparing in the benzene

1 concentration, for example, she back-calculated
2 what the benzene concentration would be in an area
3 that we contend is not a waste. So it's
4 irrelevant what the benzene concentration would be
5 at that location.

6 And so I'm trying to see at what point
7 in the process she will acknowledge that it is a
8 waste, and what point in the process before that
9 it is a product.

10 If she can't answer, or isn't qualified
11 to make that distinction, then I'll change my line
12 of questioning.

13 HEARING OFFICER FAY: All right. Go
14 ahead.

15 MS. POOLE: Would you repeat the
16 question, please?

17 MR. GALATI: Yes.

18 BY MR. GALATI:

19 Q Would you characterize produced water,
20 or let's just call it water mixed with oil in a
21 crude oil tank, would you characterize that water
22 as waste?

23 A Let me preface my answer with a few
24 remarks. There are separate regulations that
25 apply to waste and the treatment of waste. And

1 those regulations are some of the most complex
2 portions of California's hazardous waste
3 regulations.

4 And those determinations are extremely
5 difficult to make. And in my opinion it calls for
6 a legal analysis and opinion.

7 Q Okay, so your testimony and your written
8 testimony and today on back-calculating benzene
9 prior to the flotation cells, I want to look at
10 that portion of the stream, you can't say, as you
11 sit here today, that that's a waste at that point?

12 A I don't believe I argued that it was a
13 waste. What I said was the back calculation
14 yields a concentration of benzene that exceeds the
15 regulatory levels.

16 Q And if it is not a waste, there would be
17 no regulatory levels applied to that stream,
18 correct?

19 MS. POOLE: That calls for a legal
20 opinion. She's already testified that we're
21 talking about treatment regulations as well as
22 waste regulations.

23 MR. GALATI: Oh, I'm sorry, I didn't
24 hear that part.

25 //

1 BY MR. GALATI:

2 Q Don't you have to be treating a waste to
3 fall under the treatment regulations? Do you know
4 that answer?

5 MS. POOLE: Counsel, these are legal
6 questions. I object to this line of questioning.

7 HEARING OFFICER FAY: Well, she can
8 answer, I believe. If she's not able to answer
9 we'd like to know that. But I think it is
10 reasonable for us to determine if there was a
11 point in the waste stream that Dr. Fox was
12 focusing on.

13 The issue appears to be when the
14 regulations would apply. If the regulations don't
15 apply then it's an entirely different matter.

16 DR. FOX: In order to answer that
17 question I would have to have the regulations in
18 front of me, and a lot of additional information
19 that I don't have on the specifics of that
20 treatment system.

21 I have spent months working on similar
22 problems for clients, and I'm familiar with the
23 issues that you're raising, the issues of
24 recycling, the issues of commercial products,
25 waste products versus commercial products. I am

1 familiar with all of that.

2 And I am familiar enough to know that
3 it's extremely complex, and it really calls for a
4 legal opinion and I'm not going to give one off
5 the top of my head sitting here without more
6 information than the regulations in my hands.

7 BY MR. GALATI:

8 Q I understand, Dr. Fox, and I'm going to
9 move on, okay? But I would like to ask you if you
10 can agree that according to attachment A, which
11 was the diagram that you put up on the overhead,
12 would you agree that oil is still being taken out
13 of the produced water at the filter stage?

14 A At the filter stage, ahead of the ion
15 exchange unit?

16 Q That's correct.

17 A It's not intentionally being taken out
18 at that point. It's intentionally taken out in
19 the oil/water separator and the dissolved air
20 flotation unit. Some of the oil ends up on the
21 filter.

22 Q And how do you know that, Dr. Fox?

23 A Based on my experience with treatment
24 systems.

25 Q And have you had experience with the TCI

1 2-22 treatment facility?

2 A No, I don't know the details of it, but
3 based on what you've provided it doesn't appear to
4 me that you are intentionally taking oil at that
5 step.

6 Q Doesn't the filter backwash go to a tank
7 in which oil is then recovered and then sent back
8 to the oil/water separation according to the plant
9 diagram?

10 A Yes.

11 Q So, you'd be speculating as to what the
12 intent of the filters were, wouldn't you?

13 A My point is that the filter is not
14 designed to take oil out. You inadvertently take
15 some oil out across the filters. Then you have to
16 remove it from the backwash stream. But the
17 purpose of the filtration system is not to take
18 oil out typically.

19 Q And the purpose of removing it from the
20 backwash stream is not to add to the commercial
21 product?

22 A The purpose of taking it out of the
23 backwash stream is because I believe that there is
24 a condition in your agreement with Valley Waste
25 that you have to meet a certain oil and grease

1 level in order to discharge your wastewater into
2 their ponds.

3 Q And that's 72 ppm?

4 A I don't remember the number.

5 Q Thank you.

6 A It's 7-something.

7 Q Thank you. I want to now talk about the
8 sample results. The numbers you put up, aren't
9 those the numbers on the inlet, the outlet, the
10 regeneration and the filter backwash, aren't they
11 all significantly -- the test results --
12 significantly below the STLC numbers?

13 A Yes.

14 Q In fact, aren't most of the test results
15 less than, like for example, less than .02?

16 A Yes.

17 Q That means that the lab, it could be,
18 it's possible that that result could be .0000001,
19 isn't that correct?

20 A There were two sets of samples
21 collected, the December 28th samples analyzed by
22 Zalco, most of the metals were N/D. The first set
23 of samples analyzed by Precision Analytical many
24 of the metals were detected.

25 In the second set of samples on December

1 28th detection limits were reported in most cases.

2 Q For example in lead, which you just
3 testified that if you multiplied that by 64 on the
4 Pacific Analytical samples, wasn't the inlet
5 sample less than 0.2?

6 A Yes.

7 Q And so the inlet sample could have been
8 extremely low?

9 A Yes, it could have been.

10 Q And aren't we talking about -- let's
11 take the outlet sample on that day for lead. It
12 was .8 mg/liter. That's still a very small
13 amount, isn't it?

14 A It's a lot higher than the drinking
15 water standards. I wouldn't call it a small
16 amount.

17 HEARING OFFICER FAY: Excuse me, Mr.
18 Galati, Commissioner Moore has had to leave the
19 hearing. Is there any objection for his temporary
20 absence?

21 MR. GALATI: No, no objection.

22 HEARING OFFICER FAY: Fine, then we'll
23 proceed.

24 MR. GALATI: As a matter of course, we
25 don't object when a Commissioner leaves.

1 BY MR. GALATI:

2 Q With respect to comparing these numbers,
3 for example, chromium, .03 to the outlet of .02 on
4 11/15. Those are extremely low numbers, correct?

5 A Yes, they are.

6 Q I mean one particle could really make a
7 difference?

8 A One particle?

9 Q Yeah, one small particle in the numbers
10 we're talking about here could really make a
11 difference in the test results?

12 A From a chemical standpoint I'm not sure
13 what you mean by a particle.

14 Q Well, the TTLC for chromium is 2500
15 mg/liter, correct?

16 A Correct.

17 Q And the STLC is 500?

18 A Correct.

19 Q And we're talking .03 to .02.

20 A Correct.

21 Q And so if you had one small either,
22 let's say a particle, let's dust-size, that would
23 make a big difference in a mg/liter between .03 to
24 .02?

25 A Are you talking about a particle of

1 chromium?

2 Q Yes.

3 A I'm sorry, I can't relate to particles
4 of chromium.

5 Q Are you assuming it's all soluble?

6 A Pardon?

7 Q You've assumed it's all soluble, haven't
8 you?

9 A No, I don't think I made any specific
10 assumption about that. I'm troubled by the use of
11 the word particle.

12 Q Okay. I acknowledge that I don't have
13 the experience you do in this area, please tell me
14 the word you'd like me to use to be clear.

15 A Is your question if you add a small
16 amount of copper to the water, the concentration
17 would be higher?

18 Q Actually, can I use the term grain?
19 Would that help, instead of particle?

20 A How about gram.

21 Q Well, I don't want to say gram, that has
22 a particular weight. I'm talking about a small
23 amount, whatever amount you want to call it,
24 grain, particle, piece of chromium. When you
25 compare .03 to .02 a very very small piece could

1 make a big difference --

2 A Okay, sure.

3 Q -- in those kind of concentrations?

4 A Yeah. I mean I could do a calculation
5 and tell you how many grams you'd need to add to
6 the water to increase the concentration to some
7 other number.

8 Q Well, what I'm getting at is when you're
9 dealing with these very small numbers, isn't this
10 kind of within the noise of the sample?

11 A No, it's not within the noise of the
12 sample.

13 Q It's significant between .03 to .02 when
14 we're comparing this to an STLC of 500?

15 A The purpose of my remarks were to
16 demonstrate that the data that we were given is
17 not representative of the process. I don't know
18 whether .02 or .002 or 20 or 200 is the correct
19 number.

20 The overriding conclusion that one gets
21 from looking at this number, these numbers, is
22 that they are physically inconsistent with the ion
23 exchange system.

24 I don't know, as I sit here, whether the
25 real numbers are .0001 or 10 or 100 or 1000. The

1 only conclusion that I can draw is that the data
2 is inconsistent with the physics of an ion
3 exchange system.

4 I don't know what the problem is. I
5 don't know whether it's a sampling problem, an
6 analytical problem, or some other problem, but
7 there's clearly a problem with the data.

8 And I'm not suggesting that copper,
9 which you're focusing on, is necessarily a
10 constituent that would lead to an exceedence of a
11 TTLC or an STLC. I'm using this data simply to
12 illustrate the fact that the data are flawed.

13 Q DTSC did not find the data to be flawed,
14 did they?

15 A DTSC was not aware of the framework
16 within which this data was to be evaluated. They
17 didn't understand the Sunrise project. They
18 didn't understand -- I have had conversations with
19 DTSC and I have been told --

20 MR. GALATI: I'd object to any --

21 DR. FOX: -- they were not aware --

22 MR. GALATI: -- any testimony regarding
23 conversations with DTSC --

24 MS. POOLE: Counsel, you just asked what
25 DTSC, what their problem -- whether they had any

1 problems. She's responding to the question.

2 MR. GALATI: I think that --

3 DR. FOX: I have had conversations
4 with --

5 MR. GALATI: -- we can have that
6 response on the record when DTSC was here,
7 testified, and was cross-examined by you and your
8 witness.

9 HEARING OFFICER FAY: Counsel, we're
10 going to overrule that. It's clearly hearsay, and
11 to that extent subject to objection. But I think
12 you did ask regarding DTSC's reliance, and I think
13 Dr. Fox has her own opinion on why and how they
14 relied on it.

15 We're going to overrule the objection.

16 DR. FOX: Let me summarize. I have
17 spoken with Diane Peebler about this data. And
18 explained to her my concerns. And in the course
19 of that conversation I learned that she -- DTSC
20 was reorganized right in the middle of this
21 project, and it ended up on her desk at the last
22 minute.

23 She was not familiar with the framework
24 of this work, and she is not personally familiar
25 with ion exchange systems. She did not, for

1 example, know that the brine stream was supposed
2 to be concentrated compared to the inlet.

3 I expressed to her my concerns with the
4 data. And she said that they would discuss it
5 internally and re-evaluate their position.

6 BY MR. GALATI:

7 Q Do you know Diana Peebler's
8 qualifications?

9 A Pardon?

10 Q Do you know her qualifications?

11 A No, I do not have her rÇsumÇ.

12 Q Would it surprise you that she's a
13 registered environmental health specialist?

14 A No.

15 Q Would it surprise you that she's in the
16 waste management unit?

17 A No, I know that.

18 Q Thank you.

19 CROSS-EXAMINATION

20 BY MR. GALATI:

21 Q Dr. Page, your testimony you attached a
22 calculation?

23 A Yes, I did.

24 Q I believe it's attachment A to your
25 testimony, is that correct?

1 MS. POOLE: His qualifications aren't
2 labeled as an attachment, but they are attached to
3 his testimony.

4 MR. GALATI: Oh, I'm sorry, the
5 calculations are what I'm --

6 DR. PAGE: Attachment 1, I believe.

7 MR. GALATI: Okay, thank you.

8 BY MR. GALATI:

9 Q And in that calculation you took the
10 brine solution and ran it through to come up with
11 this concentration factor of 64, is that a fair
12 characterization?

13 A Well, that's half of the
14 characterization. I took the inlet water and
15 compared it to the brine solution and came up with
16 the concentration factor.

17 Q Okay. And in that calculation you came
18 up with, and I'm looking to brine through-put --

19 A Yes.

20 Q -- 63.55 liters?

21 A Yes.

22 Q That's the amount of the brine solution?

23 A That's the amount of brine solution per
24 cubic foot of resin.

25 Q Okay. And you took that number and

1 that's how you came out -- that was one of the
2 numbers you used to come out with the
3 concentration factor of 64, correct?

4 A That's correct.

5 Q You're familiar with the way
6 regeneration, the regenerating process of ion
7 exchange systems, correct?

8 A Yes.

9 Q When the regeneration brine is pumped
10 into the softeners for the ion exchange system,
11 isn't there water already in there?

12 A Yes, there is.

13 Q Okay. And at the end of the cycle how
14 do you get the regeneration brine out of the
15 softeners?

16 A With a rinse step.

17 Q Okay. And your 63.55 liters does not
18 include the amount of water that would be in the
19 system, or the amount of water in the rinse step,
20 does it?

21 A That's right, it does not. And the
22 reason -- do you want to hear the reason?

23 Q Yes, please.

24 A Because the sample was taken while the
25 regeneration brine was running through the system.

1 If the sample would have been taken from the
2 wastewater tank where the hold-up water was
3 displaced and the rinse water was collected, then
4 it would have been appropriate to account for
5 those numbers.

6 But the sample was not taken from the
7 tank, the sample was taken from the regeneration
8 line, so you would not see the effect of that
9 dilution in that line while the brine was running
10 through the resin.

11 Q But the regeneration line represents the
12 waste stream, doesn't it?

13 A Well, it represents the line in which
14 the waste stream is flowing. A more
15 representative description would have been for a
16 system that is as dynamic as a regeneration step,
17 it would have been far more representative to wait
18 until the end of the regeneration step, and then
19 you would have had that dilution that you just
20 mentioned. And then taken a sample from that
21 tank. But that isn't how the sample was taken.

22 Q Well, what I'm getting at is your -- I
23 think Dr. Fox had testified in using the 64
24 concentration number is that the waste stream
25 associated with regeneration, you should take a

1 factor of 64 times either the inlet, or in her
2 case, the outlet, and that should be the
3 concentration in the waste stream associated with
4 regeneration --

5 A On the average --

6 Q But that's not correct, is it, because
7 it doesn't take into account the water and the
8 dilution of the stream?

9 A That's correct.

10 Q So it would be less than 64?

11 A It would be less than 64.

12 Q Thank you.

13 MR. GALATI: No further questions.

14 DR. PAGE: But not significantly less.

15 MR. GALATI: I have no further

16 questions.

17 HEARING OFFICER FAY: Okay. Staff, any
18 questions?

19 MS. HOLMES: We have no questions.

20 HEARING OFFICER FAY: Okay. Any
21 redirect?

22 MS. POOLE: Yes.

23 REDIRECT EXAMINATION

24 BY MS. POOLE:

25 Q Dr. Fox, when you back-calculated the

1 benzene estimate in your testimony you were
2 focusing on the constituents in the produced water
3 when it first enters TCI's treatment facility,
4 correct?

5 A Correct.

6 Q And, Dr. Page, you just had this
7 discussion about the concentration factor of 64,
8 and you stated at the end that you wouldn't expect
9 the concentration to be significantly less. Can
10 you explain that, please?

11 DR. PAGE: Yeah. The amount of water
12 that would be on the resin bed at the beginning of
13 the cycle would be about .4 of a cubic foot of
14 water, that is the void space of a resin bed is
15 about 40 percent.

16 And my calculation is based on per cubic
17 foot of resin. So the dilution from that later
18 would be about .4 of a cubic foot.

19 The rinse water, well, that's not a
20 number that we have available to us, but according
21 to my experience I wouldn't expect more than about
22 three bed volumes of water for the rinse. And so
23 that means that the rinse water would have been
24 about 3 cubic feet.

25 However, as I pointed out, the sample

1 that we were looking at was not taken from the
2 tank. And none of that dilution water would have
3 appeared in the sample that we were given.

4 MS. POOLE: Thank you, that's all I
5 have.

6 HEARING OFFICER FAY: Is there anything
7 further, then, on the water sampling?

8 MR. GALATI: Actually I do have some
9 rebuttal.

10 HEARING OFFICER FAY: Oh, you do?

11 MR. GALATI: Yes.

12 HEARING OFFICER FAY: All right. We'll
13 go ahead through that and then take a -- how much
14 rebuttal do you have?

15 MR. GALATI: I think probably five, ten
16 minutes on my side.

17 HEARING OFFICER FAY: Let's go ahead.

18 MR. GALATI: Okay. At this time I'd
19 like to introduce and have sworn Mr. Richard
20 Casagrande.

21 HEARING OFFICER FAY: Please swear the
22 witness.

23 Whereupon,

24 RICHARD CASAGRANDE
25 was called as a witness herein and after first

1 being duly sworn, was examined and testified as
2 follows:

3 DIRECT EXAMINATION

4 BY MR. GALATI:

5 Q Mr. Casagrande, could you please state
6 your name for the record, your place of
7 employment, address, and briefly summarize your
8 qualifications?

9 A My name is Richard Michael Casagrande.
10 I'm President of RAM Environmental Engineering.
11 My background is in public health. I worked in
12 Kern County for the Public Health Department,
13 Environmental Health. I'm a registered
14 environmental health specialist. I teach courses
15 in hazardous waste management at Bakersfield
16 College.

17 From the late '70s until 1989 I ran the
18 Kern County's Hazardous Materials Program where we
19 addressed many of these issues. My company is a
20 full turnkey operation company with geotechnical
21 and engineering staff. And a field staff where we
22 do take samples such as this.

23 I also co-authored the California
24 Compliance School with representatives of DTSC.
25 The compliance school is essentially a generator's

1 approach to how to comply with these various
2 complex hazardous waste laws. And we train
3 people, we teach people on how to sample, how to
4 evaluate, and when to do it.

5 Q And, Mr. Casagrande, you heard the
6 testimony today of Dr. Fox?

7 A Yes.

8 Q And do you have any comments about that
9 testimony? Let's start first with the questions
10 that were pertaining to when the produced water
11 becomes a waste, if at all.

12 A Well, yeah. In looking at this block
13 flow diagram and being familiar with --

14 HEARING OFFICER FAY: Would you describe
15 the document you're referring to?

16 MR. CASAGRANDE: It's the station 2-22
17 that you were given previously.

18 HEARING OFFICER FAY: Thank you.

19 MR. GALATI: That's attachment A to I
20 believe exhibit 102.

21 MR. CASAGRANDE: What we find is a
22 material, oil and water, mostly water, and a
23 generator, a company who is taking the oil and
24 recovering it because it's a valuable commodity.

25 Throughout this whole process, in

1 addition to the oil commodity, I find that water
2 is also a valuable commodity and I can explain why
3 in a minute. That water, because it has such low
4 concentrations of these dissolved metals, is
5 valuable for producing steam.

6 So all they need to do is filter it,
7 soften it, polish it. And it can be used as steam
8 back into their process for producing oil.

9 Really this whole process generates a
10 waste only at specific times, not internally, not
11 at the floating cells, not at the filters, as it's
12 going through that process. It is not a waste.
13 It's all product. They're making oil, they're
14 making water.

15 And in fact, I will submit to you, also,
16 since 1982 I've been on the water district board
17 of directors, West Kern Water District, since
18 1982, currently vice president.

19 We sell water to the oil fields. We
20 would love to sell them water. Their produced
21 water is such good quality they can polish it,
22 filter it and use it. What they don't use or from
23 that process they may produce waste.

24 Those wastes will be determined using
25 the strategies that DTSC has developed to

1 determine whether that waste is hazardous or not.
2 And what you found in testimony from Diana Peebler
3 was it was not hazardous.

4 Diana is a registered environmental
5 health specialist, having taken the registration
6 test for the State of California. I know that
7 some of that dealt with water treatment. I took
8 the same test.

9 So, I think that answers your question
10 as to whether or not this is a waste, and where
11 would it become a waste, and whether or not we are
12 dealing with more a commodity.

13 Q In your opinion the tests of the inlet
14 and the regeneration brine and the filter
15 backwash, are those tests reliable data?

16 A Well, they're reliable in that they were
17 sent to a state certified lab on two occasions.
18 They're reliable as a representative of that unit
19 that they were taken from.

20 To the best that we could explain. In
21 other words, these systems -- and your diagram
22 isn't exactly the way it's there out in the
23 field -- they are in series and they're in
24 parallel. The system is going all the time at
25 various states of being in regeneration or being

1 backflushed.

2 So when you take a sample the results
3 were so small in comparison to the standard of
4 being hazardous, that would be not remarkable.

5 And I think that was the testimony that
6 Randy Marx gave also, they were just very very low
7 concentrations. Not rising to the level of being
8 hazardous per a Title 22.

9 DIRECT EXAMINATION

10 BY MR. GALATI:

11 Q Okay, let me ask a question to Ms.
12 Rogalla and Mr. Marx. With respect to did you
13 hear Dr. Fox's testimony about the concentration
14 of lead and it being compared to the STLC value
15 from Pacific Analytics test on 11/15?

16 MS. ROGALLA: Yes.

17 MR. GALATI: And do you have any
18 comments regarding her conclusions?

19 MS. ROGALLA: With regard to the
20 analytical results and comparison with the STLCs,
21 the samples were not filtered in the field,
22 therefore any of the results that we're looking at
23 here are representative of total metals.

24 It's important to make that distinction,
25 because even a low amount of turbidity or, as

1 Mr. Galati was referring to earlier, any amount of
2 particulate matter in these samples could have a
3 very large effect on these very low
4 concentrations. And that really is what we're
5 looking at here.

6 Comparing a very low number to a very
7 low number, we don't have much change in
8 magnitude. And so making a determination that the
9 data don't make any sense is pushing it a bit, in
10 my experience.

11 MR. GALATI: And, Mr. Casagrande, I'll
12 direct this question to you. With respect to Dr.
13 Page's testimony and the concentration, do you
14 have any opinions regarding that?

15 MR. CASAGRANDE: Well, looking at
16 whether a material -- when does it become a waste
17 and if it becomes a waste, taking a theoretical
18 and mathematical model and using that to determine
19 whether a material is hazardous, much less whether
20 it's a waste or not, but whether it rises to a
21 level of being hazardous is something we don't do
22 in the field.

23 And, in fact, the regulations would
24 rather you not do that. And the state's program
25 doesn't want you to do that. The state's program

1 wants you to sample actually your waste stream,
2 generators of waste must sample their waste
3 stream, and then compare that result to the levels
4 that are found in the regulations.

5 And this is what Diana Peebler, did,
6 looked at the results of analysis, not a
7 theoretical model.

8 One further thing, there's a section in
9 the hazardous waste regulations and it refers to
10 this whole process here, and really it's a key
11 point, that when a material is being in-process it
12 is not a waste. It's only when it exits that
13 process that it becomes a waste. And only then is
14 when you sample it.

15 Polishing it, filtering it, and so on is
16 not a waste treatment. It's not a waste.

17 MR. GALATI: Mr. Casagrande, you
18 obviously reviewed the test results from the 15th
19 and from December 28th, correct?

20 MR. CASAGRANDE: Yes, I did.

21 MR. GALATI: Did you find there was good
22 correlation between the numbers?

23 MR. CASAGRANDE: Within the range, yeah.
24 They were not significantly different from a waste
25 category analysis. From looking at it as to

1 whether it is hazardous or not.

2 MR. GALATI: No further questions, and
3 the panel's tendered for cross -- recross.

4 HEARING OFFICER FAY: Okay. Staff?
5 Nothing. Any recross?

6 MS. POOLE: May we have just a minute?

7 HEARING OFFICER FAY: Sure, why don't we
8 take a five-minute break now and we'll come back.

9 (Brief recess.)

10 MS. POOLE: We're on the record?

11 HEARING OFFICER FAY: Yes.

12 CROSS-EXAMINATION

13 BY MS. POOLE:

14 Q Ms. Rogalla, --

15 (Pause.)

16 HEARING OFFICER FAY: Ms. Poole, could
17 you rearrange things to cross-examine Mr.
18 Casagrande first. He has to leave in ten minutes.

19 MS. POOLE: Yeah, I think we can do
20 that.

21 BY MS. POOLE:

22 Q Mr. Casagrande, is it your testimony
23 that oil recovery in the thermally enhanced oil
24 recovery process includes the steps between oil
25 coming out of the well through at least part of

1 the water treatment process?

2 A It's all part of the oil recovery
3 process.

4 Q Thank you. And what portion of the
5 regulations were you referring to in your
6 testimony regarding when wastes become wastes?

7 A It's in Title 22, or you might find it
8 in Title 26 of the California Code of Regulations.
9 And it's that section that refers to an in-process
10 stream that talks in terms of a materials in
11 process are not considered waste until they exit
12 that process.

13 Or until that process is stopped. And
14 then it becomes a waste. So a generator wouldn't
15 be able to say I'm constantly going to go ahead
16 and do this work. And then never have to test
17 their waste, or test their material as to whether
18 it's hazardous.

19 Q Can you give me a cite to that specific
20 regulation?

21 A I teach it in compliance school up and
22 down the State of California and I use it, and I
23 have it in our compliance book. And I don't
24 remember the specific. I could get that for you
25 and submit it to the Commission.

1 MR. GALATI: Mr. Marx can answer that
2 question, if you like.

3 MS. POOLE: Please.

4 MR. MARX: I believe it's 22 -- Title
5 22, California Code of Regulations, section 66260
6 or 66261. Those are the two sections that have to
7 do with hazardous waste definition.

8 MS. POOLE: Those are very large
9 sections.

10 MR. MARX: I know.

11 MS. POOLE: You can't pin it down in
12 there?

13 MR. MARX: Well, I could if I had a
14 copy.

15 MS. POOLE: Thank you.

16 BY MS. POOLE:

17 Q Mr. Casagrande, I have a copy of test
18 method 6010B in front of me. And I'd like you to
19 take a look at a portion of this, please.

20 Would you please read the portion of
21 that test method that's in the parentheses on the
22 page I showed you?

23 MR. CASAGRANDE: What section of this
24 were you looking at?

25 MS. POOLE: The sentence which is below

1 the acronyms in parentheses.

2 MR. CASAGRANDE: Parentheses, a control
3 limit of plus or minus 20 percent?

4 MS. POOLE: Yes, please.

5 MR. CASAGRANDE: -- built in percent
6 difference, or within the document in historical
7 acceptance limits for each matrix shall be used
8 for sample values greater than 10 times the
9 instrument detection limit.

10 MS. POOLE: Thank you. And I have just
11 put in front of you what has been marked as
12 exhibit 90, the water test results dated January
13 4, 2000. On that page are the November 15th
14 sampling results.

15 Can you tell me what test method was
16 used for those sampling results?

17 MR. CASAGRANDE: It appears that they
18 did the soluble threshold limit concentration
19 test. They used methods found in the SW846; they
20 used a 6010 method.

21 MS. POOLE: Thank you. That's all I
22 have for Mr. Casagrande.

23 HEARING OFFICER FAY: Does staff have
24 any questions of Mr. Casagrande? Any --

25 MR. GALATI: No further questions for

1 me.

2 HEARING OFFICER FAY: Okay, thank you
3 very much, Mr. Casagrande.

4 MR. CASAGRANDE: Thank you very much.

5 HEARING OFFICER FAY: We appreciate your
6 testimony. You are excused.

7 CURE may continue with questioning the
8 rest of the panel.

9 BY MS. POOLE:

10 Q Ms. Rogalla, I've just shown you the
11 same page which I showed Mr. Casagrande, which are
12 the November 15th test results from exhibit 90.
13 Do you have that in front of you?

14 MS. ROGALLA: Yes, I do.

15 MS. POOLE: And do you see the standards
16 column there?

17 MS. ROGALLA: The STLC column, is that
18 what you're referring to?

19 MS. POOLE: Yes.

20 MS. ROGALLA: Yes.

21 MS. POOLE: And what does STLC stand
22 for?

23 MS. ROGALLA: It stands for soluble
24 threshold limit concentration.

25 MS. POOLE: And what is immediately to

1 the left of that STLC column?

2 MS. ROGALLA: The results.

3 MS. POOLE: And the lab, in preparing
4 that sheet, compared the results to the STLC,
5 correct?

6 MS. ROGALLA: Yes, they did. Well, they
7 don't actually compare them, they report them,
8 though.

9 MS. POOLE: Thank you. Are you familiar
10 with test method 3010?

11 MS. ROGALLA: Yes.

12 MS. POOLE: And that test method was
13 used for those samples, correct?

14 MS. ROGALLA: That's the preparation of
15 it.

16 MS. POOLE: And does that include a
17 filter step?

18 MS. ROGALLA: Not necessarily.

19 MS. POOLE: Do you know whether it did
20 in this case?

21 MS. ROGALLA: I don't know for sure if
22 it did in this case, however these samples were
23 acidified upon collection in the field, in which
24 case any metals adsorbed to particulates in those
25 samples would have been dissolved in the sample.

1 So any subsequent filtration would not have been
2 likely to be successful or entirely successful in
3 removing any additional metals.

4 MS. POOLE: Thank you, that's all I
5 have.

6 MR. GALATI: For the whole panel?

7 HEARING OFFICER FAY: Is that it for the
8 entire panel?

9 MS. POOLE: Yes.

10 HEARING OFFICER FAY: All right, any
11 redirect?

12 MR. GALATI: Yes, on that last question.

13 REDIRECT EXAMINATION

14 BY MR. GALATI:

15 Q So, Ms. Rogalla, do you believe that the
16 results represent the total metal content?

17 A I believe they're more representative of
18 total metals than they would be of soluble metals.

19 Q Thank you.

20 MR. GALATI: No further questions.

21 HEARING OFFICER FAY: Okay. Anything
22 further then on the water treatment testing?

23 MR. GALATI: No.

24 HEARING OFFICER FAY: Nothing further,
25 then, from any of the parties?

1 MS. HOLMES: Staff does have something
2 further on water treatment in response to Dr.
3 Fox's testimony this morning that Ms. Peebler was
4 reconsidering her position.

5 Staff contacted Ms. Peebler at DTSC
6 during the break and she informed us that she is
7 not changing her testimony before the Commission.

8 HEARING OFFICER FAY: Thank you very
9 much.

10 All right, I believe that concludes the
11 testimony on water treatment sampling.

12 And if I recall correctly we were
13 receiving CURE's direct testimony on operation
14 impacts in air quality.

15 MS. POOLE: Yes, I would like to move
16 exhibits 103, 104, 105 and 106 into the record.

17 HEARING OFFICER FAY: Any objection?

18 MR. GALATI: No objection.

19 HEARING OFFICER FAY: So moved.

20 Ms. Poole, do you need a moment to shift
21 gears, here?

22 MS. POOLE: Just a moment, if we could,
23 please, to rearrange our papers.

24 HEARING OFFICER FAY: Sure.

25 MS. HOLMES: Mr. Fay, --

1 HEARING OFFICER FAY: Yes, Ms. Holmes.

2 MS. HOLMES: -- before we move to air
3 quality, which is what I believe you're doing, we
4 have our biology witness here to talk to the
5 Committee about a visit to Valley Waste. Perhaps
6 this would be a good time to hear his testimony.

7 HEARING OFFICER FAY: Sure, while the
8 parties are shifting gears if you could very
9 briefly summarize. I understand that it makes no
10 change in staff position.

11 MS. POOLE: I do object to this
12 testimony. This visit to Valley Waste occurred
13 with parties and agencies involved in this. We
14 were not informed of this visit and would very
15 much like to have attended. And I believe the
16 Commission's rules require that we have been
17 noticed about this.

18 HEARING OFFICER FAY: Do you want to
19 address that, Ms. Holmes?

20 MS. HOLMES: It's my understanding that
21 staff did attend with some of the representatives
22 of the agencies, and one representative from the
23 Sunrise project. However, it's also my
24 understanding that there were no substantive
25 discussions that took place. It was merely site

1 visit to visually observe the Valley Waste
2 treatment facility.

3 And staff also discussed, I believe, its
4 previous conversation with the director whose name
5 I cannot remember right now. And reconfirmed the
6 statements that he had made to staff prior to the
7 last hearing.

8 There was no meeting in the sense of
9 issue resolution as between the parties.

10 MS. POOLE: If there's no substantive
11 discussion or issue resolution then I don't see
12 why we need any further testimony on this matter.

13 MR. GRATTAN: That's agreeable to us.

14 MS. HOLMES: That's fine with the staff.

15 MR. GRATTAN: The testimony stands.

16 MS. HOLMES: We were under the
17 impression that the Committee was looking for
18 staff's response. It does not change staff's
19 conclusions.

20 HEARING OFFICER FAY: The response is in
21 the docket, why don't we just leave it at that.
22 And I don't believe we have to even deal with the
23 objection, if staff is comfortable with just
24 leaving the report of the visit in the record as
25 it stands.

1 MS. HOLMES: That's fine.

2 HEARING OFFICER FAY: Okay, fine.

3 (Pause.)

4 HEARING OFFICER FAY: I believe we're at
5 the point where CURE is still -- have you begun
6 your direct testimony on operation impacts?

7 MS. POOLE: We have not yet begun, so --

8 HEARING OFFICER FAY: Okay, --

9 MS. POOLE: -- this will be our --

10 HEARING OFFICER FAY: -- so, please,
11 whenever you're ready.

12 MS. POOLE: -- initial direct testimony
13 on operational impacts.

14 DIRECT EXAMINATION

15 BY MS. POOLE:

16 Q Dr. Fox, would you please state your
17 name for the record.

18 A Phyllis Fox.

19 Q And was the air quality testimony
20 submitted on behalf of CURE which has been marked
21 as exhibit 56 prepared by you or under your
22 direction?

23 A It was.

24 Q Have you reviewed the air quality
25 testimony filed by other parties in this case?

1 A I have.

2 Q Do you have any comment you'd like to
3 make on that testimony?

4 A I have two issues that I would like to
5 address. The first one is the CO catalyst, and
6 the second one is the PM10 emission level. And
7 I'm going to take them one at a time.

8 In the case of carbon monoxide or CO,
9 this project has been issued a final determination
10 of compliance which specifies a CO permit limit of
11 6 ppm at 15 percent oxygen averaged over three
12 hours.

13 And it is my understanding that this
14 limit will be met without using a CO oxidation
15 catalyst. The applicant has proposed to meet this
16 limit with a CO oxidation catalyst.

17 It is also my understanding that the
18 turbine vendor will not guarantee 6 ppm CO. The
19 level that the vendor is willing to guarantee is 9
20 ppm.

21 The applicant, however, believes that
22 they can meet 6 without a CO oxidation catalyst.
23 And I have a lot of problems with that. I feel if
24 the vendor isn't willing to guarantee an emission
25 limit of 6 ppm, I believe it's unlikely that the

1 applicant will be able to meet that level without
2 a CO oxidation catalyst.

3 CO oxidation catalysts are used on
4 almost all of the plants that are before the
5 Commission right now. I had someone compile a
6 list of projects that will be using CO oxidation
7 catalysts, and they include the Sutter Project,
8 High Desert, LaPaloma, Elk Hills, Three Mountain,
9 Pittsburg, the Midway Sunset Project and Pastoria.

10 And I believe the Commission should
11 require that the Sunrise Project uses CO oxidation
12 catalysts for two reasons: First, to assure that
13 the permit limit of 6 is actually complied with.
14 And second, as mitigation for significant acute
15 health impacts that we previously discussed in the
16 public health section.

17 I'd like to move on to the PM10 issue.
18 The PM10 issue is actually quite similar to the CO
19 issue. Before I launch into this, I need to make
20 a few introductory remarks.

21 PM10 or particulate matter comes in two
22 flavors. The first flavor is referred to as
23 filterable PM10 or the so-called front half. And
24 that fraction of PM10 is the stuff that you can
25 see. It's the grime that settles on your tables

1 and furniture.

2 The second half is called the
3 condensable, or the back half in the analytical
4 test. And that fraction you can't see. And it's
5 not necessarily present in the stack gases that
6 are emitted, but it forms in the atmosphere
7 through chemical reactions.

8 And the sum of those two, the sum of the
9 filterable and the condensable equals PM10.

10 In this case, the turbine vendor is only
11 willing to guarantee an emission limit of 18
12 pounds per hour. Half of that is filterable.
13 Half of that is condensable.

14 This project has received a final
15 determination of compliance and is proposing to
16 offset only 9 pounds per hour. One of the
17 problems with setting an emission limit on PM10,
18 which is half of what the vendor is willing to
19 guarantee is that it would be very difficult to
20 catch exceedences, because you cannot continuously
21 monitor PM10. PM10 is only measured through
22 periodic stack tests.

23 And, of course, for a stack test you
24 always fine tune everything so that you don't
25 violate any of your permit limits.

1 So what we have here is a situation
2 where he vendor is willing to guarantee only 18,
3 all of the emissions data that has been submitted
4 and are present in the AFC, and even in the
5 appendices to the FDOC are based on emissions at
6 18 pounds per hour. Yet the project is offsetting
7 only 9 pounds per hour, or half of that amount.

8 And I would like to comment on and
9 critique Mr. Stein's testimony entitled air
10 quality combustion turbine PM10 emission rate and
11 emission reduction credits, in which this issue is
12 discussed.

13 MS. POOLE: That's been marked as
14 exhibit 51.

15 HEARING OFFICER FAY: Thank you.

16 DR. FOX: And what Mr. Stein does in
17 this exhibit is attempt to demonstrate that the
18 Sunrise Project can indeed meet 9 pounds per hour,
19 even though the vendor won't guarantee it.

20 And the way he demonstrated it is he
21 took 12 source tests for two power plants in Kern
22 County, the Kern River Project and the Sycamore
23 Project, and he summarized PM10 emissions. And
24 then he calculated from that summary the percent
25 of the total PM that was condensable and the

1 percent that was filterable.

2 And then he took those percentages and
3 he applied them to the Crockett Cogen facility.
4 And he picked the Crockett Cogen facility because
5 the turbine at that facility is very similar to
6 the turbine that would be used by the Sunrise
7 plant.

8 So he took the source test for Crockett.
9 And in the Crockett source test they only measured
10 filterable PM10, they didn't measure the
11 condensables. So there's no number for total. So
12 you can't use the Crockett number unless you
13 adjust the filterable to a total basis.

14 So Mr. Stein totaled these 12
15 measurements from these two plants in Kern County,
16 figured out the percent that was condensable, and
17 he applied that to adjust the Crockett numbers.
18 And based on that he concluded that a similar size
19 turbine, source tested in the Bay Area, could meet
20 the 9 pounds per hour.

21 Now, I'm going to critique that
22 analysis. The first problem I have with it is the
23 Crockett turbine was a prototype turbine, first of
24 its class, and GE no longer makes it. And there
25 have been a lot of compliance problems at that

1 facility with carbon monoxide specifically, that
2 most people believe are related to the fact that
3 this is an unusual turbine. It really isn't that
4 similar to the turbine that the Sunrise plant will
5 use. So that's the first problem I have.

6 The second problem is the table that Mr.
7 Stein used in his testimony labeled PM-1, table
8 PM-1, didn't make any adjustment for the fact that
9 the Kern River and Sycamore facilities are much
10 smaller than the Sunrise project. In fact,
11 there's a factor of two difference in the size.

12 And when you adjust the PM10 emissions
13 in Mr. Stein's table PM-1, to account for the
14 difference in size, you'll find that one of his
15 source tests actually exceed the 9 pound per hour
16 limit, making the case that indeed there's likely
17 to be a compliance problem.

18 I, in my comments on the PSA, I believe,
19 prepared my own summary of source test in an
20 attempt to determine whether or not the 9 pound
21 per hour limit could be met. And I summarized 20
22 source tests on GE frame 7's of various sizes.

23 And what I found was seven out of those
24 20 source tests exceeded the 9 pound per hour
25 limit proposed by the Sunrise project. That's 35

1 percent of similar Frame 7's.

2 I also summarized 17 source tests for
3 other types of turbines, derivative turbines and
4 Siemens rather than GE Frame 7's. And there I
5 found that seven out of the 17 or 41 percent
6 exceeded the 9 pound per hour limit that has been
7 proposed.

8 And then a final problem I have with the
9 use of the Crockett facility to represent the
10 Sunrise project is the PM10 emissions depend, in
11 large measure, on where the plant is located.
12 Because a lot of the PM10 you see in the exhaust
13 gases actually come from the combustion air that's
14 sucked into the turbine.

15 So if the power plant is sitting in an
16 area with very high particulate matter
17 concentrations in the air, like in Kern County,
18 you would expect to see much higher concentrations
19 of PM10 in the exhaust gases than you would in an
20 area like the Bay Area where the Crockett plant is
21 where PM10 concentrations are lower.

22 And in Mr. Stein's analysis he didn't
23 make any adjustment for the differences in PM10
24 concentrations in looking at the plant.

25 Staff, in its FSA, evaluated my analysis

1 that I just summarized for you. And ignored
2 virtually all of my source tests except one, and
3 they relied again on the Crockett facility,
4 overlooking the other 30-odd source tests that I
5 had. And argued again, based just on the Crockett
6 test, which only measured filterable PM10, that
7 they believed that a 9 pound per hour limit could
8 be met.

9 I believe that it is not wise to offset
10 and permit a project at PM10 and carbon monoxide
11 levels that the vendor won't guarantee.

12 BY MS. POOLE:

13 Q Does that conclude your direct
14 testimony?

15 A It does.

16 MS. POOLE: The witness is available for
17 cross.

18 HEARING OFFICER FAY: Mr. Galati.

19 MR. GALATI: Before we do cross-
20 examination, let co-counsel address this.

21 MR. GRATTAN: Yeah, maybe we can save
22 some cross-examination time. At this point in
23 listening to the portion of Dr. Fox's testimony
24 with regard to the oxidation catalyst, I think Dr.
25 Fox's point is well taken. I think that it is a

1 good idea for this Commission to view similar
2 projects, and view the requirements imposed upon
3 similar projects, particularly neighboring
4 projects that have been permitted by this
5 Commission.

6 And we certainly would like to see that
7 applied across-the-board, given an absence of
8 unusual circumstances.

9 So we're prepared, at this time, like
10 LaPaloma and like Pittsburg, permitted projects,
11 two recently permitted by the Commission, to
12 install an oxidation catalyst.

13 And we would be submitting minor errata
14 to address where it's referenced, where the
15 manufacturer's guarantees are addressed in, I
16 think, air quality 3 and 4.

17 PRESIDING MEMBER MOORE: Mr. Grattan,
18 that would be in lieu of acquiring any additional
19 offsets?

20 MR. GRATTAN: Offsets weren't an issue
21 with the CO catalyst. That's a PM10 issue, and
22 that's a very different issue. This is an issue
23 of whether to put on a CO catalyst or rely on a
24 manufacturer's guarantee.

25 PRESIDING MEMBER MOORE: Sorry.

1 MR. GRATTAN: Thank you.

2 HEARING OFFICER FAY: Tank you, Mr.

3 Grattan. That moves things along. We're always
4 looking for agreement.

5 MR. GALATI: And we haven't been able to
6 find very much.

7 MS. POOLE: We're pleased to hear it.

8 DR. FOX: We're very pleased. That will
9 save a lot of arguing.

10 CROSS-EXAMINATION

11 BY MR. GALATI:

12 Q Dr. Fox, doesn't the determination of
13 compliance limit the Sunrise project on PM10
14 emissions to 9 pounds per hour?

15 A Yes, it does.

16 Q And if the Sunrise project were to
17 exceed those limits they'd be in violation of that
18 permit?

19 A Yes, if you caught them.

20 Q And is there anything that prohibits the
21 district from asking for a source test at anytime?

22 A No, there's not, but they typically
23 don't do that.

24 Q So you're speculating as to what the
25 district will do in this case?

1 A Well, I know that the permit requires,
2 in the case of PM10, a source test on start-up, a
3 source test within six months, and thereafter on
4 an annual basis.

5 Q But there's nothing that would prohibit
6 the additional source test by the district,
7 correct?

8 A There's nothing that would prohibit it.

9 Q And, again, you would be speculating if
10 you said the district would not ask for a source
11 test?

12 A I'm not entirely speculating, based on
13 my experience with the San Joaquin Valley, they
14 don't, on their own, trigger a lot of source tests
15 because they're staff-limited.

16 Q Okay. Dr. Fox, who assumes the risk of
17 meeting the 9 pounds per hour?

18 A Would you repeat that?

19 Q Who assumes the risk of meeting the 9
20 pounds per hour PM10 emission limit?

21 A The applicant. And the exposed public.

22 Q Understanding you disagree whether the
23 district would actually catch a violation, but
24 assuming the district did catch a violation of the
25 9 pound per hour PM10 emission limit, just for

1 purposes of my question, can we agree to assume
2 that?

3 A Okay.

4 Q The district could take enforcement
5 action, though, if they found that violation,
6 couldn't they?

7 A Well, based on your -- the applicant's
8 record with respect to NOVs, I'm not so --

9 Q Does the Sunrise -- excuse me --

10 A -- sure that enforcement would --

11 Q Excuse me, does the Sunrise project have
12 any NOVs?

13 A Huh?

14 Q Excuse me, does the Sunrise project have
15 any NOVs?

16 A Texaco does and --

17 Q Thank you.

18 A -- Texaco is one of the owners.

19 Q Thank you, I think that answers my
20 question. My question to you was not whether or
21 not somebody else has NOVs, my question to you was
22 could the district enforce if they found a
23 violation of PM10 hourly emission rate?

24 A They could issue an NOV.

25 Q And couldn't they also prohibit further

1 generation at that project based on those -- any
2 violation?

3 A They could do that, as well.

4 Q Thank you.

5 MR. GALATI: I have no further
6 questions.

7 HEARING OFFICER FAY: Thank you. Staff?

8 MS. HOLMES: I'm not sure if this is an
9 operational impact or an indirect impact. I had a
10 couple of questions about the -- and it may be
11 affected, actually, by what's been discussed here,
12 the CO as an ozone precursor. Is this the
13 appropriate time to ask those questions?

14 PRESIDING MEMBER MOORE: They're back to
15 back, so it's --

16 MS. HOLMES: Okay, I just had a couple
17 of questions.

18 PRESIDING MEMBER MOORE: -- give it a
19 try.

20 CROSS-EXAMINATION

21 BY MS. HOLMES:

22 Q Dr. Fox, you testified that the
23 Commission should treat CO as an ozone precursor
24 in this proceeding?

25 A I'm not sure that was my testimony. The

1 discussion of CO as an ozone precursor was put in
2 there to address the frequent comments that are
3 raised with respect to requiring a lower BACT
4 level for CO.

5 And I was merely pointing out that CO
6 has impacts other than just the air quality
7 standard on CO.

8 Q And are you recommending that the Energy
9 Commission take steps in this proceeding as a
10 result of that?

11 A Not given that we have a CO catalyst on
12 this project, no. I'm very happy to hear that it
13 has a CO catalyst and that allays my fears.

14 MS. HOLMES: Thank you, then I don't
15 have any questions.

16 HEARING OFFICER FAY: Any redirect, Ms.
17 Poole?

18 MS. POOLE: Yes.

19 REDIRECT EXAMINATION

20 BY MS. POOLE:

21 Q Dr. Fox, based on your experience what
22 PM10 levels have been permitted for other power
23 plant projects?

24 A This is the only project I'm aware of
25 where it is permitted at half of the vendor

1 guarantee. The neighboring LaPaloma project which
2 uses ADB turbines, I believe, is permitted at 18.3
3 or 19. And the other projects that I'm involved
4 in that are using GE turbines are all being
5 permitted at 18 pounds per hour. This is the only
6 one that I personally have seen which is using
7 half of the vendor guarantee.

8 Q And do you think it's likely that the
9 district will detect any violation of the PM10
10 limit?

11 A I think it's very unlikely given annual
12 source tests, given Texaco's track record with
13 NOVs and given the district's actions with respect
14 to enforcing its regulations.

15 Q Thank you.

16 MS. POOLE: That's all.

17 PRESIDING MEMBER MOORE: Thank you. All
18 right.

19 MR. GALATI: I do have some rebuttal.

20 MS. POOLE: Rebuttal? I believe the
21 applicant has finished its testimony on direct
22 operational impacts.

23 MR. GALATI: Correct.

24 MS. POOLE: They were the only party
25 left to do that.

1 MR. GALATI: Yeah, and I think I'm
2 allowed to rebut.

3 HEARING OFFICER FAY: Well, I mean that
4 was a round on operational impacts. And I suppose
5 the way we've been handling it, once a round is
6 over, then applicant has a chance to rebut.

7 How long do you anticipate?

8 MR. GALATI: Just probably five minutes,
9 less than five minutes.

10 HEARING OFFICER FAY: Okay, go ahead.

11 MR. GALATI: This question's for Mr.
12 Stein.

13 DIRECT EXAMINATION

14 BY MR. GALATI:

15 Q Mr. Stein, doesn't the district, in its
16 FDOC, reflect that it is comfortable that this
17 project can meet the 9 pounds per hour of PM10
18 hourly emission rate?

19 A Yes.

20 MR. GALATI: No further questions.

21 HEARING OFFICER FAY: Great. Any
22 recross? Okay. Fine.

23 We'd like to ask the parties now to give
24 us an estimate of how long their direct is likely
25 to take on the indirect impacts of the project.

1 PRESIDING MEMBER MOORE: Indirect and
2 cumulative. Estimates.

3 HEARING OFFICER FAY: Fifteen minutes,
4 staff?

5 MS. HOLMES: Five to ten.

6 HEARING OFFICER FAY: CURE?

7 PRESIDING MEMBER MOORE: So give me
8 indirect first.

9 MS. POOLE: We may need up to an hour.

10 PRESIDING MEMBER MOORE: No. We're
11 going to take 45 minutes per side, that's the cap.
12 Constrain yourself to those and I'll hold firm on
13 those time limits.

14 Then we're going to take -- we probably
15 won't take more than a half an hour per side on
16 cumulative. And then we're going to stop.

17 So, ready to rock and roll on indirect.

18 MR. GALATI: Can I just ask one question
19 on that.

20 PRESIDING MEMBER MOORE: You certainly
21 may.

22 MR. GALATI: Does that include the
23 cross-examination time? We'll have 45 minutes for
24 our direct and their cross?

25 PRESIDING MEMBER MOORE: That's total

1 time.

2 MR. GALATI: The only thing that I would
3 like to inform the Committee is we've been
4 informed that Sayed Sadredin can be available by
5 telephone at 2:00 for any comments regarding
6 indirect impacts and --

7 PRESIDING MEMBER MOORE: And do we know
8 about the --

9 MS. HOLMES: I left a message for EPA
10 and I told them we would like to --

11 PRESIDING MEMBER MOORE: We'll interrupt
12 if --

13 MS. HOLMES: -- talk with them at 1:30.

14 PRESIDING MEMBER MOORE: -- if it
15 happens, we'll interrupt. Okay.

16 Counselor, you're on.

17 MR. GALATI: Yes.

18 HEARING OFFICER FAY: Just a moment,
19 let's go off the record a moment.

20 (Off the record.)

21 HEARING OFFICER FAY: Mr. Galati,
22 indirect air quality impacts of the project.

23 MR. GALATI: We can have the record
24 reflect that the panel is Mr. David Stein and Ms.
25 Paula Fields. They have previously been sworn.

1 HEARING OFFICER FAY: The panel members
2 are still under oath.

3 DIRECT EXAMINATION

4 BY MR. GALATI:

5 Q Ms. Fields, did you prepare testimony
6 regarding the indirect impacts on air quality for
7 this project?

8 A Yes, I did.

9 Q And was that previously filed?

10 A Yes, it was.

11 Q And I believe that was labeled as
12 exhibit 49?

13 A That's correct.

14 Q And can you affirm that testimony under
15 oath today?

16 A Yes, I can.

17 Q Do you have any changes or modification
18 to that testimony?

19 A Not related to indirects.

20 Q Okay. Yeah, I apologize, I think you
21 made all the changes to it at one time.

22 Okay, could you briefly summarize your
23 testimony for the Committee?

24 A Certainly. I supervised and assisted in
25 the preparation of the AFC and revisions and

1 responses to CEC and CURE data requests. And the
2 Sunrise comments on the PSA, and the written
3 testimony pertaining to air quality impacts from
4 the Sunrise project indirect sources.

5 Indirect sources include construction
6 and operation of the 700 new wells, and operation
7 of TCI's water treatment facility 2-22 and Valley
8 Waste wastewater facility in order to serve the
9 Sunrise project.

10 I reviewed the staff's indirect impacts
11 analysis and agree that there will be no
12 significant impacts.

13 What I'd like to do next is simply
14 review and provide some comments on our review of
15 CURE's testimony in this regard related to
16 indirect sources.

17 First of all, on the issue of NO2
18 impacts from well drilling, we disagree with
19 CURE's conclusion that well drilling will violate
20 the one-hour NO2 standard, and that impacts are
21 significant because their calculations are based
22 on flawed emission rates.

23 CURE's rates are flawed for a couple of
24 reasons. First of all, the rates they used to
25 calculate the emissions from well drilling are

1 higher than those allowed by the district's
2 prohibitory rule number 2280.

3 And secondly, the USEPA has updated
4 emission rates for these types of sources based on
5 the rates that -- the emission factors that were
6 used by CURE. The use of the new emission factors
7 indicate no violations of the NO2 standard even
8 when CURE's modeling approach is used.

9 The second issue is with regard to the
10 water treatment facility VOC emissions. We
11 disagree with CURE that either the treatment of
12 the produced water or the disposal of the
13 wastewater from the Sunrise project to Valley
14 Waste will result in any significant impacts
15 associated with VOC emissions.

16 With respect to the treatment of
17 produced water, there are no sumps associated with
18 the treatment of produced water for use in boiler
19 feedwater. Therefore, there are no VOC emissions
20 associated with water treatment sumps.

21 With respect to disposal of the
22 wastewater from the Sunrise facility the
23 facility's wastewater stream comprises primarily
24 evaporative blow-down, compressor wash and drips
25 and drains associated with the handling of

1 softened produced water.

2 The evaporative blow-down compressor
3 wash uses only West Kern Water District water as
4 makeup that contains no VOCs. The softened
5 produced water will contain on average 1 ppm VOCs.

6 These low levels of VOCs will result in
7 virtually no VOC emissions from the Sunrise
8 wastewater.

9 We disagree with CURE's apportionment of
10 Valley Waste emissions to the Sunrise project.
11 Valley Waste VOC emissions are associated with
12 existing open ponds and Sunrise's small
13 incremental addition will not require new ponds
14 nor change the surface area of the existing ponds.

15 The third issue I'd like to address has
16 to do with hydrogen sulfide emissions from well
17 operation. We disagree with CURE and do not
18 believe that the H2S emissions from well operation
19 are significant.

20 When CURE's estimates are corrected for
21 the appropriate control efficiency and the correct
22 number of wells, which is 455 production wells out
23 of the 700 estimated, and even if tank emissions
24 are included in the calculations, CURE's own
25 modeling results indicate that the impact is

1 insignificant.

2 This is extremely conservative since
3 CURE double counted the fugitive emission sources
4 in their calculations. Even without correcting
5 this error, and using CURE's average background
6 measurements of H2S, with which we disagree, the
7 maximum impact is less than the H2S ambient air
8 quality standard of 42 mcg/cubic meter.

9 That concludes my summary.

10 MR. GALATI: The panel is available for
11 cross.

12 PRESIDING MEMBER MOORE: I have a
13 question for Ms. Fields.

14 EXAMINATION

15 BY PRESIDING MEMBER MOORE:

16 Q And that is the 42 mcg/cubic meter is
17 published in what document?

18 A That's the ARB's ambient air quality
19 standard for hydrogen sulfide in Title 17 in the
20 California Code of Regulations.

21 Q And the year? Is that the current
22 regulation, the one that is in --

23 A Yes, sir.

24 Q -- force right now?

25 A Um-hum.

1 PRESIDING MEMBER MOORE: Thank you.

2 HEARING OFFICER FAY: Staff, cross-
3 examination of the panel?

4 MS. HOLMES: We don't have any.

5 HEARING OFFICER FAY: All right. CURE.

6 MS. POOLE: No questions.

7 HEARING OFFICER FAY: No questions. All
8 right, thank you.

9 Staff, do you have testimony to offer on
10 indirect impacts of the project?

11 MS. HOLMES: Yes, we do. We'd recall
12 Mr. Joe Loyer.

13 HEARING OFFICER FAY: Has Mr. Loyer been
14 previously sworn in this case?

15 MS. HOLMES: Yes.

16 HEARING OFFICER FAY: All right. I
17 remind you that you're still under oath, Mr.
18 Loyer.

19 DIRECT EXAMINATION

20 BY MS. HOLMES:

21 Q Mr. Loyer, could you briefly summarize
22 your testimony with respect to indirect impacts?

23 A Sure. Staff looked at the indirect
24 impacts for the Sunrise project. They include the
25 oil field as it has been described by applicant,

1 which includes construction and operation. And
2 we're doing operation at this point?

3 PRESIDING MEMBER MOORE: Yes.

4 HEARING OFFICER FAY: This is indirect
5 impacts.

6 MS. HOLMES: Indirect impacts.

7 PRESIDING MEMBER MOORE: I'm sorry, boy,
8 I answered that wrong.

9 MR. LOYER: Okay, let's see. And the
10 wastewater treatment facility. The VOC emissions
11 from the well field operation and the H2S
12 emissions from the well field operation were
13 investigated thoroughly by staff. And we found
14 that there was no compelling evidence to suggest
15 that there would be any significant impact from
16 either VOC emissions or H2S emissions.

17 The wastewater treatment facility.
18 Staff investigated the potential emissions --
19 additional emissions from the waste treatment
20 facility and found no compelling evidence to
21 suggest that there would be any significant
22 impacts from the water treatment facility.

23 On indirect impacts, I believe that
24 concludes staff's analysis.

25 //

1 BY MS. HOLMES:

2 Q Thank you. Mr. Loyer, on page 6 of
3 exhibit 56, which is Dr. Fox's testimony there's a
4 discussion about H2S impacts, and she explains, as
5 I understand it, her analysis as including all
6 2000 wells within the three-quarter mile circle.
7 Do you recollect that testimony?

8 A Yes, I do.

9 Q And were you present at workshops at
10 which Texaco discussed what would happen to the
11 steam generators that are currently in that area?

12 A Yes, I was.

13 Q And based on those discussions do you
14 believe it would be appropriate to include all
15 2000 wells in the analysis?

16 A No, I do not.

17 Q Can you explain why not?

18 A The field steam generators at that time,
19 and as far as I know currently, Texaco is not sure
20 whether or not they will be moving those field
21 steam generators anywhere. They're not sure if
22 the field steam generators will go away entirely.
23 They're not sure if they will stay where they are.
24 They're not sure if they will move into a new
25 area. They simply are not sure what they are

1 going to do at this point.

2 Q Thank you. And with respect to the
3 discussion about the control factor for the tanks
4 and wells, do you recollect CURE's discussion on
5 that issue?

6 A Yes, I do.

7 Q And can you please summarize where you
8 derived your control factor from?

9 A During the workshop with the district
10 and all parties present, we discussed the
11 preliminary determination of compliance and the
12 staff PSA for the air quality section.

13 At that time the district staff stated
14 in the workshop that the control method for the
15 oil wells would effectively control vapors to 99.9
16 percent.

17 Q Thank you.

18 MS. HOLMES: Those, I think, conclude
19 the staff's direct testimony, and Mr. Loyer is
20 available for cross-examination.

21 HEARING OFFICER FAY: Applicant?

22 MR. GALATI: No cross-examination.

23 HEARING OFFICER FAY: CURE?

24 MS. POOLE: Yes.

25 HEARING OFFICER FAY: How much time do

1 you think you have on cross?

2 MS. POOLE: Maybe about 15 minutes.

3 HEARING OFFICER FAY: Okay.

4 CROSS-EXAMINATION

5 BY MS. POOLE:

6 Q Mr. Loyer, you were just referring to
7 control methods that were discussed at a workshop
8 down at the district. Is that well vapor control
9 required in a district rule?

10 A There is well vapor requirements in
11 district rules.

12 Q And do those requirements require vapor
13 control to 99.9 percent?

14 A No. The control level required by rule
15 is only 99 percent.

16 Q And to your knowledge is Texaco planning
17 to shut down steam generators currently feeding
18 wells in the three-quarter mile radius?

19 A They have identified that as one of the
20 possibilities.

21 Q But they're not currently planning to do
22 that, to your knowledge?

23 A To my knowledge they haven't identified
24 what they plan to do with the field steam
25 generators.

1 Q So they're not planning to shut them
2 down right now to your knowledge?

3 MS. HOLMES: Objection. I think the
4 witness has answered the question.

5 HEARING OFFICER FAY: Yeah, that's asked
6 and answered.

7 PRESIDING MEMBER MOORE: That's
8 sustained.

9 BY MS. POOLE:

10 Q In table 14 of your testimony which is
11 page 24, --

12 A And 23.

13 Q And 23. It's just page 24 in my --

14 A Oh, --

15 Q The heading is on page 23. The well
16 drilling estimates there, excuse me, the NO2
17 estimates from well drilling are based on CURE's
18 PSA comments, correct?

19 A I'm sorry, you're going to have to be a
20 little bit more clear what you're referring to.

21 Q On this table you have identified what
22 you call the maximum construction impacts from a
23 single well. And let's say in that column marked
24 impacts, which is the third column.

25 I believe you state in here that that

1 number is drawn from CURE's PSA comments, is that
2 correct?

3 A I believe the modeling analysis that led
4 up to this impact was done by CURE. But I don't
5 believe the CURE analysis included this particular
6 impact. But I'm going to have to refresh my
7 memory on this. I've been dealing with several
8 other projects.

9 (Pause.)

10 BY MS. POOLE:

11 Q I may be able to help you.

12 A Yeah, please.

13 Q If you look on page 23, the sentence
14 that begins directly under air quality table 13,
15 says, CURE in their comments on the preliminary
16 staff assessment estimated the emissions reported
17 in air quality table 13, is that right?

18 A That appears to be correct. I think
19 that is correct.

20 Q And then you talk about additional
21 modeling analysis, and you say later in that
22 paragraph that those modeling results which were
23 performed by CURE are shown in air quality table
24 14.

25 A I'll take my testimony as read.

1 Q Okay. Now, do you have Dr. Fox's
2 testimony in front of you?

3 A Which particular one?

4 Q The one that's been marked as exhibit
5 56, which is the air quality impacts.

6 A Yes, I believe that's this one here.

7 Q Yes, I'm going to ask you to refer to an
8 attachment, which it doesn't like you have.

9 A No, I don't have that much strength.

10 HEARING OFFICER FAY: Which attachment,
11 counsel?

12 MS. POOLE: Attachment 1 to portions of
13 CURE's PSA comments.

14 Why don't you use mine.

15 MS. HOLMES: He's got one right here.

16 MR. LOYER: No, I -- okay.

17 BY MS. POOLE:

18 Q On page 17 of attachment 1.

19 A Okay.

20 Q Would you look at that table there,
21 please. That identified the NO2 impacts from well
22 drilling, correct?

23 A This is the unnumbered table?

24 Q Yes. It's the only table on page 17.

25 A NO2 one-hour averaging, 539 mcg/cubic

1 meter.

2 Q Right. That identifies the NO2 impacts
3 from well drilling, correct?

4 A According to CURE it does.

5 Q And what is the modeled impacts listed
6 there for NO2?

7 A 539 mcg/cubic meter. Is that the number
8 you're referring to?

9 Q Yes, thank you. This differs from the
10 impact that you listed in air quality table 14 as
11 the total impact, correct?

12 A Yes, it does.

13 Q And that differs because you added 97 as
14 a background while CURE added the number of 188,
15 correct?

16 A CURE added 188 for a variety of reasons
17 which I will let CURE discuss. And I added 97 as
18 the background.

19 Q And 97 is only the NO2 background,
20 correct?

21 A That is the NO2 monitoring background,
22 yes, it is.

23 Q Is there ozone in the atmosphere around
24 this project?

25 A There is likely to be ozone in the air

1 around the project.

2 Q Isn't it true that NO will react with
3 ozone in the atmosphere to form NO2?

4 A Yes. It's a known reaction in air
5 chemistry.

6 Q How much NO2 will that reaction form?

7 A Typically it's a very fast reaction,
8 that's a near field event. The reaction will
9 continue until the ozone is depleted, or the NO2
10 is depleted.

11 Q So it will form more than zero amount of
12 NO2 if there's ozone in the background?

13 A It can.

14 Q If there's ozone in the atmosphere and
15 NO is added, NO2 will be formed, correct?

16 A Yes.

17 Q Did you include that amount that would
18 be formed from that reaction in your calculation
19 of background impacts?

20 A No, I did not.

21 Q Have you imposed any condition requiring
22 that wells be drilled one at a time?

23 A If I could just -- are we kind of done
24 with this --

25 Q Yes, we're done with the table.

1 A Okay, good. I'd like to put this away.

2 I'm sorry, can you re-ask the question?

3 Q Yes. Have you imposed any condition
4 requiring that wells be drilled one at a time?

5 A No, I have not.

6 Q I'm going to ask you to suppose that two
7 nearby wells are being drilled at the same time,
8 and one is upwind of the other. Would both of
9 those well drilling operations affect the downwind
10 ambient air quality?

11 A Downwind ambient air quality. For CO?
12 PM10?

13 Q For NO2 in particular.

14 A NO2. Downwind for NO2. Yeah, it's
15 likely for a near field they would have some sort
16 of impact.

17 Q Is it possible that the combined impacts
18 would exceed the one-hour NO2 standard?

19 A I think that is speculative. And I
20 don't know if I can answer that.

21 Q I thought we were done, but let me refer
22 you back to air quality table 14 in your testimony
23 where you identify the total impact from drilling
24 one well in NO2 is 448 mcg/cubic meter.

25 A Yes, ma'am.

1 Q And the limiting standard is 470
2 mcg/cubic meter. That NO2 impact that you've
3 calculated from drilling a single well is close to
4 that limiting standard, is it not?

5 A Yes, it is.

6 Q Now, if two wells were being drilled at
7 the same time, and one was upwind of the other,
8 isn't it possible that the NO2 standard could be
9 exceeded?

10 A It's a possibility, but there are
11 several other contributing factors that would have
12 to be taken into consideration. So, whether or
13 not it would is anybody's guess until you measure
14 it, monitor it, model it.

15 Q Did you model the possibility?

16 A No, I did not.

17 Q How many offsets has the air district
18 required for the 700 new wells associated with
19 this project?

20 A I'm not aware that the district has
21 required any offsets at this point for any new
22 wells that Texaco may be drilling in this area or
23 any other.

24 Q So you can't confirm that emissions from
25 the 700 new wells associated with this project

1 have been fully offset?

2 A I'm not aware that Texaco has proposed
3 to actually drill 700 new wells to the district
4 yet. So if you're asking me if they have provided
5 mitigation for wells that they are not sure
6 they're going to drill, I would say I have no
7 knowledge of such mitigation being provided.

8 Q On page 25 of your testimony you assume
9 a 99.9 percent control factor for vapor recovery
10 on storage tanks, correct?

11 A Yes, ma'am.

12 Q What's your basis for assuming this
13 control factor?

14 A That was previously identified in the
15 workshop as the control measure that the district
16 claims that they are imposing at this time.

17 Q I thought we were talking about vapors
18 from wells at the workshop.

19 A They discussed with me that the same
20 vapor controls are also put on the tanks.

21 Q Are you familiar with district rule
22 4623?

23 A You'll have to remind me what that one
24 is.

25 Q That requires 95 percent vapor control

1 on certain storage tanks.

2 A Yes.

3 Q And that is a 95 percent control factor
4 in that rule, correct?

5 A That's in the rule, yes.

6 Q Do all of Texaco's storage tanks
7 currently comply with rule 4623?

8 A I didn't investigate all of Texaco's
9 storage tanks.

10 Q Do you know of any that don't comply
11 with rule --

12 MS. HOLMES: I'm going to object to this
13 question. It goes beyond the scope of the
14 witness' testimony. The witness looked at the 700
15 new wells that are proposed to be built. The
16 witness did not examine Texaco oil field
17 operations.

18 MS. POOLE: The witness is assuming that
19 a certain level of emissions will come out of
20 these storage tanks in his testimony. And I'm
21 questioning that basis for that assumption.

22 HEARING OFFICER FAY: The blueprint
23 limited the examination of indirect impacts to the
24 700 wells. So we'll sustain the objection.

25 //

1 BY MS. POOLE:

2 Q Are you aware of any impacts from
3 hydrogen sulfide on oil field workers in the
4 Midway Sunset Oil Field?

5 MR. GALATI: Again, I'd object as to
6 relevance.

7 MS. POOLE: The relevance is that
8 hydrogen sulfide impacts come from drilling new
9 wells.

10 MR. GALATI: And --

11 MS. HOLMES: I'm going to join in this.
12 This is not a worker safety or a public health --

13 MS. POOLE: I'm not asking a public
14 safety or worker health question, I'm going to H2S
15 emissions from oil wells.

16 MS. HOLMES: His testimony on --

17 HEARING OFFICER FAY: But it sounds like
18 it --

19 MS. HOLMES: -- H2S emissions goes to
20 whether or not there's a violation of the
21 standard. That's the scope of the air quality
22 testimony.

23 HEARING OFFICER FAY: Yeah, it sounds
24 like it's beyond the scope and we just can't
25 afford to deal with a general, we're dealing with

1 this specific project. Sustained.

2 BY MS. POOLE:

3 Q Do you know when the 700 new wells that
4 staff has estimated will be associated with this
5 project will be drilled?

6 A My understanding is that Texaco will be
7 drilling these within the next, I believe it's
8 five years.

9 Q I have here a record of conversation
10 which was docketed on October 1, 1999. I'd like
11 you to refer to that, please.

12 Could you please read the sentence
13 that's marked with the blue mark?

14 A Could you --

15 MS. HOLMES: I don't even understand who
16 this reported conversation is from.

17 MS. POOLE: Look at the front page.

18 MR. LOYER: I think it's this front
19 page.

20 MS. POOLE: It's a record of
21 conversation docketed by Marc Pryor.

22 (Pause.)

23 BY MS. POOLE:

24 Q Do you see the sentence that's been
25 marked with a blue pen mark?

1 A Yeah. We should say that this is a
2 conversation, report of conversation between Marc
3 Pryor and Mervyn Soares.

4 Q Thanks. Would you please read that
5 sentence that's been marked.

6 A You mean, under the plan?

7 Q Yes.

8 A Okay. Under this plan the wells are
9 predicted to spread out over the six-year period
10 from 1999 to 2004. The plan shows 65 percent of
11 the wells as oil production wells, and the
12 remaining 35 percent as steam injection wells.

13 Is that all?

14 Q And I guess I should ask you to read the
15 first sentence to identify what the plan is.

16 A Oh, the strategic plan that was used to
17 generate the area of influence radius and number
18 of new wells went through 2004. Okay.

19 Q Thank you.

20 MS. POOLE: That's all my questions.

21 HEARING OFFICER FAY: Thank you. Any
22 redirect?

23 MS. HOLMES: Can I have a moment?

24 HEARING OFFICER FAY: Sure.

25 MS. HOLMES: I just have one question.

1 PRESIDING MEMBER MOORE: One redirect.

2 MS. HOLMES: Yes.

3 REDIRECT EXAMINATION

4 BY MS. HOLMES:

5 Q Mr. Loyer, there was discussion earlier
6 this morning about various control efficiencies.
7 Could you tell me what your understanding is of
8 the basis of the district's statement that a 99.9
9 percent control efficiency is required?

10 A The basis of that statement is it was
11 related to me by the district is that that is
12 their current BACT control level.

13 PRESIDING MEMBER MOORE: B-A-C-T?

14 MR. LOYER: Yes, sir.

15 MS. HOLMES: Thank you. I have no
16 additional questions.

17 HEARING OFFICER FAY: Applicant?

18 MR. GALATI: No.

19 HEARING OFFICER FAY: CURE?

20 MS. POOLE: No.

21 PRESIDING MEMBER MOORE: Okay, it's five
22 after 12:00. We'll take a half an hour. At 12:35
23 we'll be back and start again.

24 HEARING OFFICER FAY: We're off the
25 record now.

1 (Whereupon, at 12:05 p.m., the hearing
2 was adjourned, to reconvene at 12:35
3 p.m., this same day.)

1 AFTERNOON SESSION

2 12:37 p.m.

3 HEARING OFFICER FAY: Please begin.

4 PRESIDING MEMBER MOORE: Right, sorry.

5 MS. POOLE: Are we ready to begin?

6 HEARING OFFICER FAY: Yes.

7 PRESIDING MEMBER MOORE: Ready to go.

8 Ms. Poole.

9 DIRECT EXAMINATION

10 BY MS. POOLE:

11 Q Dr. Fox, --

12 A Yes.

13 Q -- have you reviewed the other parties'
14 testimonies regarding indirect impacts?

15 A I'm sure I have.

16 Q And --

17 (Laughter.)

18 DR. FOX: I don't have any specific
19 recollection at the moment, however.

20 (Laughter.)

21 MR. GALATI: Then would it be fair to
22 characterize you agree with the --

23 (Laughter.)

24 BY MS. POOLE:

25 Q To the best of your recollection are

1 there some items you would like to address?

2 A Yes. Given my 45-minute time limit I
3 would like to focus on two topics only, and what
4 I'd like to do is combine my direct with rebuttal
5 of both parties.

6 And the first thing I'd like to talk
7 about is the drill rigs. The applicant did an
8 analysis of drill rig emissions and found no
9 significant impact.

10 We did our own analysis using the
11 emission factor from AP-42, which is jargon for
12 EPA's emission estimating bible. And in our
13 analysis we used the applicant's stack parameters,
14 which I believe are not representative of drill
15 rigs, but we nevertheless used them because it
16 provides a worst case.

17 And the only changes we made to their
18 analysis was we used the AP-42 emission factors,
19 and we used a different MET data set. But the MET
20 data set's not on the table here because we're
21 dealing with one-hour impacts. And the MET data
22 set doesn't really make any difference.

23 In our modeling we found that the
24 drilling of a single well would exceed the state
25 one-hour NO2 standard.

1 Staff used our analysis in their FSA and
2 I believe table 14 on pages 23 and 24 that counsel
3 was asking Mr. Loyer about this morning, and that
4 analysis is our analysis with one exception. And
5 staff, in picking up the numbers from our PSA
6 comments did not include one component of the NO2.

7 I need to give you a little background
8 on this NO2 issue, because it's a little esoteric.

9 When you burn a gas in a turbine you
10 form a mixture of nitrogen oxides. Basically NO,
11 and NO2. And the state standard is on NO2.

12 And there are three pieces that you have
13 to add together to get the concentration from
14 turbine exhaust. The first piece is referred to
15 as thermal NOx, and that's the amount of NO2 that
16 forms in the stack. So you have a certain amount
17 of NO2 at the stack as it comes out.

18 The second piece of it is the NO that is
19 in the stack gases that are emitted react with
20 ozone in the atmosphere to form an additional
21 amount of NO2.

22 And the third piece is the background
23 NO2 concentration in the area. And in order to
24 get the NO2 impact from a turbine you have to add
25 those three pieces together.

1 Staff added two of them together, the
2 background NO2 and the thermal NOx from the stack.
3 But they did not add the increment due to the
4 reaction of NO in the exhaust gases with ozone in
5 the atmosphere. And when you add that piece in
6 you find that the drilling of a single well
7 exceeds the state one-hour NO2 standard.

8 This method I just described of adding
9 three pieces together is a standard method that's
10 used throughout California. It's been adopted by
11 CARB. It's based on a referee journal article
12 called, A Review of Techniques Available for
13 Estimating Short-Term NO2 Concentrations.

14 That's an article that was published in
15 the Journal of the Air Pollution Control
16 Association, 1979, page 812 through 817. And in
17 there there's a section called ozone limiting
18 method. And that is the method that has been
19 adopted by CARB and is used for modeling NO2
20 impacts in California.

21 When you make that correction in the
22 staff's analysis what you have is a violation of
23 the state standard from the drilling of a single
24 well.

25 This project will drill 700 wells over a

1 six-year period, which means that you have the
2 potential for violating the standard up to 700
3 times. Actually more than that, because this is a
4 one-hour standard, and the drilling takes place in
5 the course of an eight- to 12-hour day. And 36
6 percent of the time you have meteorological
7 conditions that would lead to a violation of the
8 standard.

9 So you could exceed the standard well
10 over 2000 times over the course of that six-year
11 period.

12 Now, the applicant critiqued our
13 analysis of drilling emissions. And one of the
14 things that they say in their written testimony
15 and that Ms. Fields just stated in her direct, was
16 that we used flawed emission factors. And that
17 they used more recent emission factors. That's
18 absolutely false.

19 The emission factors that the applicant
20 used in their calculations are not for drillings
21 at all. They're for construction equipment. And
22 I'd like to remind you of an irony.

23 In the last air session that we had here
24 we were talking about construction emissions. And
25 in that discussion of construction emissions what

1 we learned was the applicant modeled construction
2 emissions using stack parameters for drill rigs.

3 Why? Because drill rig stack parameters
4 grossly underestimate the impacts of construction
5 emissions.

6 Here we come to the indirect session and
7 we're dealing with drill rigs, you would expect
8 the applicant to use emission factors for drill
9 rigs, right? No. The applicant is using emission
10 factors for construction equipment.

11 And there's a big difference between a
12 drill rig and construction equipment. First, the
13 emission factors that they relied on were based on
14 1991 to 1998 engines. Most drill rigs use old
15 outdated dirty engines with no controls on them.

16 The second big difference is the
17 operational mode of a drill rig as opposed to
18 construction equipment. Drill rigs have to drive
19 half a million to a million pounds of steel into
20 the ground, whereas construction equipment clearly
21 doesn't do that, you know, you have start/stop,
22 and you're digging dirt and pushing dirt around.

23 So, the difference in the operational
24 mode and the age and pipes of engines that you
25 find result in very different emissions factors.

1 So it is quite inappropriate to use emission
2 factors for construction equipment to estimate the
3 impacts from drill rigs, which is what has
4 happened here.

5 Another problem with the analysis that
6 the applicant did is they applied a mode factor to
7 calculate a one-hour impact. A mode factor
8 represents the percent of the time that the engine
9 is operating at full load. And it's appropriate
10 to use a load factor when you're looking at a long
11 period of time like over a 12-hour day, or over a
12 month. Because clearly, over an extended period
13 of time, a drill rig is not going to be operating
14 at full bore continuously.

15 But when you're estimating hourly
16 average impacts, it is entirely feasible to expect
17 that a drill rig would operate full bore for a
18 solid hour. So it's really inappropriate to take
19 an emission factor for construction equipment and
20 multiply it by 65 percent, which is the load
21 factor.

22 So what we have here is a situation
23 where the applicant has under-estimated the
24 emissions from drill rigs by at least a factor of
25 two. And when you correct those problems in the

1 applicant's analysis, you end up at the same place
2 that we ended up, concluding that drilling of a
3 single well will result in exceeding the one-hour
4 NOx standard.

5 Another point about the drill rigs that
6 I'd like to mention is the applicant and us used
7 for drill rigs stack parameters that are really
8 not very representative. They modeled the drill
9 rigs as four point sources so they're widely
10 spaced. No we all know that a drill rig is a
11 platform that's got three or four different diesel
12 engines on it. There's a pump, there's a
13 generator, there's a couple three or four engines,
14 each 200 to 500 horsepower in size, sitting on a
15 single platform. And all of the individual
16 engines are fairly close together.

17 The applicant modeled the drill rig as
18 four widely spaced point sources. Another problem
19 is the applicant modeled the stack from the drill
20 rigs as being 15 feet high. The stacks on these
21 rigs are usually three to 12 feet high. The
22 higher the stack the more dispersion and the lower
23 the concentrations.

24 Another problem with the applicant's
25 stack parameters is they assumed a 12-inch

1 diameter stack. The stacks on drill rigs are
2 three to four inches.

3 And the final problem is they assumed
4 that the stack was vertical and there was a
5 substantial amount of vertical momentum going up
6 that stack. I don't know if any of you have ever
7 seen drill rigs, but the stacks on the engines on
8 these rigs either have goosenecks that point like
9 this, so the gases come out and move horizontal to
10 the ground rather than shooting straight up. Or
11 the stacks, themselves, are horizontal to the
12 ground. So you have very little vertical momentum
13 and very poor dispersion of the gases.

14 So both of our analyses, both CURE's
15 analysis and the applicant's analysis, because of
16 the specification of stack parameters, actually
17 under-estimate the impacts. And the real impacts
18 are substantially higher than even what we have
19 suggested.

20 And then as to the issue of the MET data
21 set, as I said before, we used McKittrick, they
22 used Fellows. But when you're dealing with one-
23 hour impacts it really makes no difference. We
24 modeled the drill rig impacts using both
25 McKittrick and Fellows.

1 With McKittrick you get 539; and with
2 Fellows you get 522 mcg/cubic meter, both of which
3 handily violate the state one-hour standard of 470
4 mcg/cubic meter.

5 I believe that summarizes my comments on
6 drill rigs.

7 Now, I'd like to go to well operational
8 impacts. And to help you understand that I'd like
9 to discuss briefly a flow diagram I have in front
10 of me which is from exhibit 3, I believe.

11 Q Attachment 3?

12 A Attachment 3 -- attachment 2 to my air
13 quality testimony --

14 MS. POOLE: Which is exhibit 56.

15 DR. FOX: And if you don't have it in
16 front of you I have copies which I can give you so
17 you can follow along.

18 PRESIDING MEMBER MOORE: That's probably
19 easier. The one you had up on the slide?

20 DR. FOX: It's similar, but it's a
21 different figure. I thought I had an overhead of
22 it, but I have so much paper over here I can't
23 find it.

24 This is labeled figure 2, central
25 treating system for processing onshore heavy crude

1 oil from TEOR production. TEOR is thermally
2 enhanced oil recovery production. And that's
3 relevant in this case, because as you know the
4 steam from the Sunrise project will be used for
5 TEOR production of oil within a three-quarter mile
6 circle around the plant.

7 And the purpose of this figure is to
8 demonstrate that much more is involved in TEOR
9 production than the simple drilling of a well and
10 the pumping up of a mixture of oil and gas.
11 There's a large number of steps involved.

12 The oil/water mixture comes up. It goes
13 through a number of separators. You can see just
14 by glancing at this, there's separators, there's
15 sumps, there are heater treaters which is a piece
16 of fired equipment which is used to break tight
17 emulsions of oil and water.

18 And then finally you end up storing the
19 product in a tank and disposing of waste and
20 gases.

21 But the point of this is to show that
22 there are a number of steps involved in the
23 process in addition to the wellhead, itself.
24 There are separators, there are tanks, there are
25 sumps and there are heater treaters.

1 And most of these pieces of equipment
2 have emissions associated with them. And the only
3 thing that we've been talking about here is the
4 drilling of the well, and the emissions from the
5 well, itself.

6 There are, indeed, a large number of
7 other sources of emissions that have so far not
8 been dealt with in these proceedings. And we were
9 not able to calculate emissions or do any
10 estimating for them, because Texaco refused to
11 produce the data that we needed.

12 I would just like the record to show
13 that the remarks that I'm going to make about
14 hydrogen sulfide from the oil well represent a
15 substantial under-estimate of what the actual
16 emissions are, because they don't include most of
17 these sources.

18 MR. GALATI: Again, I would like to just
19 make the record clear on the comment about Texaco
20 refusing to give data. That was the subject of a
21 motion to compel. That motion was upheld by the
22 Committee that that information was not necessary
23 or relevant to their decision in this proceeding.

24 PRESIDING MEMBER MOORE: Thank you.

25 DR. FOX: Okay. In my written testimony

1 I estimate hydrogen sulfide emissions from a few
2 of the components on this figure we were just
3 talking about. I estimate emissions from the well
4 vent, itself, from the fugitives pumps and pipes
5 and from the tanks.

6 And my estimate of hydrogen sulfide
7 emissions total from assuming 700 wells, 29.6 tons
8 per year from only a few of the many potential
9 sources of hydrogen sulfide.

10 We then used standard techniques to
11 model the emissions. They are fugitive sources so
12 we modeled them as a volume source, and we
13 calculated an incremental hydrogen sulfide
14 concentration of 30 mcg/cubic meter.

15 Based on the record that the internal
16 memorandum that was read into the record during
17 the cross of Joe Loyer, I now know that 65 percent
18 of those wells are production wells and the other
19 35 percent are steam wells. So the estimate in my
20 testimony is high because I assumed that all 700
21 wells were production wells, because we were
22 unable to get any additional information from
23 Texaco.

24 Adjusting for the fact that 65 percent
25 are production wells, the model incremental

1 increase in concentration would be 18 mcg/cubic
2 meter. If you add that to the average measured
3 H2S concentration based on our field studies of
4 33, you get an ambient H2S concentration of 51
5 mcg/cubic meter.

6 The state H2S standard is 42 mcg/cubic
7 meter. So looking at just a portion of the
8 hydrogen sulfide emissions from oil field
9 operations within the three-quarter mile radius,
10 which is fair game for indirect impacts, results
11 in an exceedence of the hydrogen sulfide standard
12 which is a significant impact.

13 Now, in staff's testimony staff took
14 difference with my calculations. And staff made
15 two changes to them. First, staff argued that the
16 tanks that I had included in my calculation should
17 be considered in cumulative impacts and not in
18 indirect impacts. I disagree with that.

19 The blueprint is very clear that within
20 the three-quarter mile radius the 700 wells plus
21 appurtenant facilities are a part of the indirect
22 impacts. And tanks, as you can clearly see from
23 figure 2, which is the diagram of a TEOR process,
24 are clearly appurtenant facilities associated with
25 TEOR production. And I believe it is appropriate

1 to include those tanks in an indirect impact
2 analysis.

3 Further, even though staff argued that
4 the tanks should be part of cumulative, they in
5 fact did no analysis of hydrogen sulfide emissions
6 from the tanks in their cumulative impact
7 analysis.

8 The other criticism that staff has was
9 that I had used the wrong control efficiency for
10 well venting. In my calculations I assumed that
11 the wells were vented and that 99.5 percent of the
12 hydrogen sulfide was removed by a vapor recovery
13 system.

14 Staff argued that it should be 99.9
15 percent, and I believe you just heard the
16 discussion that the basis of that was statements
17 made by the San Joaquin Valley during a workshop,
18 and that the 99.9 percent represents BACT.

19 I'd like to make several comments on
20 that. First, the BACT determination is based on
21 volatile organic compounds, or VOCs, not hydrogen
22 sulfide. The removal efficiency for hydrogen
23 sulfide and VOCs are different.

24 The ability of a vapor recovery system
25 to burn a substance depends on the heat of

1 combustion of that substance. Hydrogen sulfide
2 has a very low heat of combustion compared to VOCs
3 like methane, ethane, propane. They heat of
4 combustion of VOCs present in these gases is like
5 20 Btus per pound, while the heat of combustion of
6 hydrogen sulfide is like 6.5 Btus per pound.

7 Therefore the removal efficiency of
8 hydrogen sulfide through a vapor recovery system
9 would be substantially lower than for VOCs. And
10 the number that staff was referring to was for
11 VOCs.

12 The second important point to realize is
13 that the BACT determination is for new equipment
14 undergoing permitting. The vapor recovery systems
15 in existence in the oil field are not new
16 equipment, and would not have had to comply with
17 that BACT determination.

18 And then finally in response to data
19 requests posed by staff, Texaco responded that the
20 control efficiency for their vapor recovery system
21 was 99 percent.

22 And then lastly in Larry Allen's remarks
23 when he appeared before you he spoke of the San
24 Luis Obispo County's experience with vapor
25 recovery systems for these wells. And I recall

1 that he stated that they typically achieved 90 to
2 95 percent VOC reduction. And that in their
3 calculations they often use a number much lower,
4 80 to 85 percent --

5 MR. GALATI: And I would object to that
6 testimony. That was not testimony in this
7 proceeding. It was comments by an agency not
8 subject to cross-examination.

9 MS. POOLE: We can refer to comments --

10 HEARING OFFICER FAY: Yeah, I think we
11 should correct the record that it was not
12 testimony.

13 BY MS. POOLE:

14 Q Just go ahead.

15 A Anyway, in sum, I used 99.5 percent
16 which I think is far too high in this case. I
17 felt like I was being very conservative by using
18 99.5 percent. I think a much more defensible
19 number would have been about 90 percent, and the
20 actual emissions of hydrogen sulfide are probably
21 much higher than what I represented them to be. I
22 was trying not to overstate this issue.

23 And then finally I think I heard Ms.
24 Holmes ask Mr. Loyer a question or make a
25 statement that suggested that my H2S calculations

1 included 2000 wells. I did two sets of
2 calculations. I calculated indirect impacts due
3 to this project alone. And then I also provided a
4 calculation for cumulative impacts.

5 And in the cumulative analysis it's
6 appropriate to consider all 2000 wells. For the
7 indirect impacts that I've been talking about
8 here, the impacts in which you get a 51 mcg/cubic
9 meter exceedence of the standard, I am only
10 referring to 65 percent of the 700 wells. I did
11 not use those calculations based on 2000 wells in
12 any of my conclusions.

13 And the only other remark that I would
14 like to make is, as I said, these comments that
15 I'm making with respect to hydrogen sulfide refer
16 only to a small number of the potential sources of
17 hydrogen sulfide within the three-quarter mile
18 radius. There are other sources that I did not
19 take into account because I did not have the data
20 I needed to make the calculations.

21 Q Does that conclude your direct
22 testimony?

23 A I believe it does. I think my written
24 testimony stands for itself. And that summarizes
25 the rebuttal I wanted to make.

1 Q Thank you.

2 MS. POOLE: The witness is available for
3 cross.

4 HEARING OFFICER FAY: Mr. Galati.

5 MR. GALATI: Yes.

6 CROSS-EXAMINATION

7 BY MR. GALATI:

8 Q I want to go to, Dr. Fox, your drill
9 rig, so well drilling impacts. You testified that
10 it was inappropriate to use a load factor for well
11 drilling?

12 A Yes, for one-hour impacts, not for daily
13 or annual average or monthly.

14 Q You testified that a drill rig typically
15 has more than one diesel engine?

16 A Yes.

17 Q Do you know why it has more than one
18 diesel engine?

19 A There's more than one function going on.
20 There's a generator, a pump.

21 Q Yeah, would it be fair to characterize
22 that one generates a pump, one drives and turns
23 the steel, and one is used for the winch to lift
24 things out of the ground?

25 A Yes.

1 Q So, if you were drilling, going full
2 bore, as you suggested, you wouldn't be lifting
3 steel out of the ground using the engine that
4 powers the winch, would you?

5 A No.

6 Q So it's appropriate to not consider all
7 three engines operating at full bore for a one-
8 hour impact, correct?

9 A Not based on the CARB -- there's a CARB
10 scenario that's on their website in conjunction
11 with the implementation of regulations for the
12 diesel PM10 regulations.

13 And I believe that that scenario shows
14 that all of those engines will operate
15 simultaneously for at least eight hours in a day.
16 Granted, during portions of the day you would have
17 two of the engines running versus three, or one
18 versus two. But there are at least eight hours of
19 overlap in a day in which all of the engines would
20 be running.

21 Q Okay, I understand you said it was
22 appropriate to use a load factor for a daily?

23 A For a daily, yes.

24 Q But my point is that it's physically
25 impossible for all three engines to be running at

1 the same time, because there would be no use for
2 at least one of them?

3 A No, I don't agree with that. Not based
4 on the CARB scenario.

5 Q Okay. Let's say you're no longer
6 drilling and now you're pulling steel out of the
7 ground. You wouldn't be operating the engine at
8 full bore turning the steel and driving it into
9 the ground, correct?

10 A Right.

11 Q And you probably wouldn't be pumping
12 drilling mud into the ground at that same time,
13 right?

14 A Right.

15 Q Thank you. Still working with well
16 drilling, there's well drilling currently going on
17 in western Kern County?

18 A Yes.

19 Q More than one operator?

20 A Yes.

21 Q Probably more than one rig going on at
22 one time?

23 A Certainly.

24 Q There's other sources of NOx in --

25 A Yes.

1 Q Has there been any violation of the NO2
2 one-hour standard recorded in the western Kern
3 County?

4 A I'm not aware that there's any measuring
5 stations in the middle of the oil fields.

6 Q How about the measuring station at
7 Fellows?

8 A That's the MET station that was formerly
9 operated by the West Side Operator?

10 Q And there was no measurement of the one-
11 hour violation of the NO2 standard at that
12 station, was there?

13 A No, there was not.

14 Q Thank you. Do you have any idea how
15 many wells are operating in western Kern County?

16 A No.

17 Q Do you have any idea how many wells are
18 being drilled at the same time in western Kern
19 County?

20 A Not as I sit here. I could get it out
21 of my files.

22 Q I want to move to well operations. You
23 referred to attachment 2 to exhibit 56, which is
24 your testimony. And you had some discussions
25 about figure 2, called central treating system for

1 processing onshore heavy crude oils from TEOR
2 production.

3 A Yes.

4 Q That's not a schematic of the TCI
5 operation, is it?

6 A No, it's generic.

7 Q Okay. In fact, isn't the source
8 reference a 1980 reference as modified in June
9 1988?

10 A Yes.

11 Q Do you have any understanding of whether
12 or not operations, typical operations in oil field
13 may have changed since 1988?

14 A Based on my field trip to the Sunrise
15 site and discussions that I had with Texaco
16 employees, I believe that the operations shown on
17 this figure take place in the Midway Sunset oil
18 field today. I believe there are oil/water
19 separators, I believe there are heater treaters, I
20 believe there are steam generators. I believe
21 there are tanks. I believe there are sumps. I
22 believe there's a vapor recovery system.

23 Q And that's based on information given to
24 you by TCI employees?

25 A Yes. I asked quite a few questions on

1 that field trip and that's what it was going at.

2 Q Okay. Is there any reference method for
3 testing H2S in ambient air?

4 A Pardon?

5 Q Is there any reference method for
6 testing H2S in ambient air?

7 A I believe that EPA has a TO series
8 method that's used.

9 Q Does CARB have any reference method for
10 testing H2S in ambient air?

11 A To the best of my knowledge CARB does
12 not have a reference method for testing hydrogen
13 sulfide in ambient air. They have a reference
14 method for testing hydrogen sulfide in stack
15 gases. Or at least there's not one indicated in
16 the index to their methods on their website.

17 Q The Jerome sampler is not a CARB
18 approved method for testing H2S in ambient air, is
19 it?

20 A No, it's not a CARB approved method, but
21 I have used data from Jerome methods in testimony
22 before juries in courts of law and it has been --

23 Q Thank you.

24 A -- accepted.

25 Q Thank you. Are you familiar with Title

1 17 California Code of Regulations, Article 2,
2 ambient air quality standards?

3 A I am familiar with the ambient air
4 quality standards. I don't know them by that
5 name.

6 Q You mentioned that it was your opinion
7 that the 700 new wells, and again I want to direct
8 your attention, 465 production wells that the
9 crude oil would be directed to old equipment, is
10 that -- was that your testimony earlier?

11 A Yes, existing oil field equipment.

12 Q Would you agree that if a well was
13 directed to new equipment that that would reduce
14 the emissions?

15 A Assuming that the most current BACT
16 levels were complied with, and assuming that BACT
17 for a vapor recovery system is indeed 99 percent,
18 as Mr. Loyer testified to, I personally don't know
19 that to be a fact. But if it was directed to a
20 vapor recovery system with a verified control
21 efficiency of 99.9 percent, that would certainly
22 go a ways to reducing the emissions, yes.

23 Q Okay, so that would be a yes, then?

24 A That's a yes, with --

25 Q Okay, thank you.

1 A -- with the caveats.

2 Q And --

3 A And assuming the 99.9 percent is for
4 hydrogen sulfide and not just VOCs.

5 MR. GALATI: I don't have any further
6 cross-examination for this witness.

7 HEARING OFFICER FAY: Staff.

8 MS. HOLMES: No questions.

9 HEARING OFFICER FAY: Redirect?

10 MS. POOLE: May I have just a moment.

11 (Pause.)

12 MS. POOLE: Ready for redirect?

13 HEARING OFFICER FAY: Proceed.

14 REDIRECT EXAMINATION

15 BY MS. POOLE:

16 Q Dr. Fox, to your knowledge is Fellows in
17 the Midway Sunset oil field?

18 A No, it's not.

19 Q And there was discussion about three
20 separate diesel engines on a drill rig. Can you
21 explain whether those three engines would operate
22 in a one-hour period?

23 A I believe based on the most recent CARB
24 drilling scenario, which I think is dated January
25 17th, that there would be at least eight hours

1 over the course of drilling a well in which all
2 three engines would be used simultaneously. And
3 certainly over a one-hour period.

4 Another important factor there is all of
5 these calculations were based on the assumption
6 that the total horsepower on the rig was 1500.
7 And if you look at the CARB scenario you find that
8 for an average oil well going to a depth of 1800
9 feet, the actual horsepower can be quite a bit
10 higher than 1500.

11 Another important point about these
12 drill rigs is all we've been talking about here is
13 the drilling of the rig. Well, once the well is
14 in place there is follow-up servicing --

15 MR. GALATI: I'd have to object that it
16 exceeds the scope of cross-examination. I crossed
17 exactly on the operation of those three engines.

18 MS. POOLE: There was some --

19 MR. GALATI: And now she's talking about
20 how the drill rig may drive, where it may go. And
21 what happens after drilling.

22 HEARING OFFICER FAY: Yeah, does this
23 relate to whether those three engines operating
24 simultaneously?

25 MS. POOLE: Okay.

1 HEARING OFFICER FAY: Withdrawn?

2 MS. POOLE: Yes.

3 HEARING OFFICER FAY: Objection

4 sustained. Move on.

5 MS. POOLE: That's all I have.

6 HEARING OFFICER FAY: Okay. Good. Any

7 recross?

8 MR. GALATI: No recross.

9 HEARING OFFICER FAY: Staff?

10 MS. HOLMES: No.

11 HEARING OFFICER FAY: Okay, thank you.

12 That concludes --

13 MR. GALATI: I do have rebuttal, though.

14 HEARING OFFICER FAY: Oh, you have

15 rebuttal.

16 MS. POOLE: I have to object again.

17 When did we suddenly change the order so that the

18 applicant routinely gets rebuttal after everybody

19 has completed their testimony on these topics?

20 HEARING OFFICER FAY: Well, I think

21 we've had rebuttals throughout the case, as I

22 recall.

23 MS. POOLE: Well, we've all, in our

24 direct testimony, been provided the opportunity to

25 rebut the written testimony. But we haven't been

1 following this procedure where the applicant gets
2 to have another round after everybody else has
3 testified, to testify again.

4 MR. GALATI: Actually, --

5 HEARING OFFICER FAY: Of course, you can
6 rebut what they said on direct, and they can't
7 until they hear what you've said on direct. So I
8 think it's reasonable, especially since the
9 applicant bears the burden in the case.

10 Let's go, but keep it brief.

11 MR. GALATI: Thank you. And I'll direct
12 this question, I'll let the panel decide how
13 they're going to answer the question, who's going
14 to answer the question.

15 DIRECT EXAMINATION

16 BY MR. GALATI:

17 Q With respect to Dr. Fox's testimony
18 regarding the modeling that was done by the
19 applicant for well drilling, do you have any
20 comments specifically addressing what she has
21 raised in the modeling method and approach?

22 MS. FIELDS: I guess what I'd like to do
23 is just clarify the fact that we didn't model well
24 drilling impacts. We simply used CURE's modeled
25 impacts and made some adjustments.

1 MR. STEIN: Let me also add that the
2 value that CURE has used which -- the procedure
3 they've used, which is to take a thermal component
4 of NO2 and then add it to an assumed simultaneous
5 background concentration of NO2 and ozone defies
6 the fact that there is available actual measured
7 values of both species that are available to
8 conduct such an analysis.

9 So by taking this 188 ppm and
10 arbitrarily adding it hour after hour to each
11 model, the hour of impact, they are over-stating
12 the impacts from these pieces of equipment.

13 In fact, the ozone values and the NO2
14 values do change hour by hour. And it is not
15 appropriate to simply select a single value and
16 apply it uniformly. It may be a very conservative
17 approach, but it's certainly not a refined
18 technique within the construct of the ozone
19 limiting method.

20 MS. FIELDS: I guess I would also like
21 to clarify, too, regarding the emission factors
22 that we used for well drilling which Dr. Fox said
23 were not appropriate, that the AP-42 factors were
24 better because they were specifically for well
25 drilling equipment.

1 The reference that I have cited in my
2 written testimony is a 1998 USEPA document
3 entitled, Exhaust Emission Factors for Nonroad
4 Emissions Modeling, Compression Edition. And it
5 is based on emission factors developed on engine
6 testing conducted from 1991 through 1998.

7 Not necessarily equipment manufactured
8 during those years, but testing done during those
9 years. And it does apply to all nonroad engines.
10 And I was assuming that well drilling equipment
11 were nonroad engines.

12 So, we still stand by our use of those
13 emission factors.

14 MR. GALATI: Now, with respect to Dr.
15 Fox's testimony on well operations, and H2S
16 emissions, do you have any comments regarding that
17 testimony?

18 MR. STEIN: Yes, I do. I'd like to
19 point out that Title 17 of the California Code of
20 Regulations is the regulation which sets forth the
21 California ambient air quality standards.

22 And those regulations specifically
23 identify a reference method for H2S in ambient
24 air. In fact, if you were to think about it
25 practically it would not make sense for an agency

1 to adopt an ambient air quality standard for which
2 they did not have a reference method to determine
3 compliance.

4 So, it is routinely done and common
5 practice for this agency to adopt not only a
6 standard, a numerical standard, but also a
7 reference method for purposes of determining
8 compliance with it.

9 And there is, in fact, one for H2S --

10 HEARING OFFICER FAY: This agency, Mr.
11 Stein, is CARB?

12 MR. STEIN: Is CARB. And it's in Title
13 17 of the California Code of Regulations. The
14 section -- it's in division 3, chapter 1,
15 subchapter 1.5, article 2, section 70200, which is
16 the table of standards.

17 That standard is, in fact, listed as
18 cadmium hydroxide extracting method. And I would
19 note for the record that the gold film method that
20 was used by CURE to measure H2S is not a cadmium
21 hydroxide extracting method.

22 Furthermore, there has been, to my
23 knowledge, no evidence presented in the record to
24 suggest that this is an equivalent procedure to
25 that method.

1 In addition, I would note that the
2 measurements conducted by CURE for background H2S
3 are 24-second samples. There is not a single
4 measured value that is a full one-hour average.
5 And so their use of this 33 mcg/cubic meter, which
6 is a mishmash of 24-second snippets of time in the
7 oil field is simply inappropriate and not
8 representative of an integrated sample for a
9 single one-hour period. And it can't be used to
10 represent background for a one-hour period.

11 We don't know what the one-hour average
12 is, but it's certainly not any composite of
13 averages taken from CURE samples, because none of
14 them are one-hour integrated averages.

15 MR. GALATI: That ends my rebuttal.

16 HEARING OFFICER FAY: Okay. Staff, any
17 questions?

18 MS. HOLMES: No questions.

19 HEARING OFFICER FAY: CURE.

20 MS. POOLE: Yes.

21 CROSS-EXAMINATION

22 BY MS. POOLE:

23 Q Mr. Stein, I've just given you a copy of
24 the description of the ozone limiting method which
25 is in the journal that Dr. Fox referred to

1 earlier. Would you please read the steps 1
2 through 4 that are marked there into the record.

3 A Yes. First a standard dispersion model
4 is used to calculate NOx max. NOx max is
5 separated into two components, a thermal
6 conversion portion for combustion sources this is
7 estimated to be 0.1 times NOx max be the remaining
8 NOx subject to the conversion by ozone is equal to
9 .9 times NOx max. If the ambient ozone level is
10 greater than .9 NOx max then assume that all of
11 the NO is converted to NO2. NO2 max equals NOx
12 max.

13 If .9 NOx max is greater than ambient,
14 ozone ambient, then set NO2 max equal to 02 --

15 PRESIDING MEMBER MOORE: Counsel, --

16 MR. STEIN: -- 03 ambient --

17 PRESIDING MEMBER MOORE: Hang on. What
18 are you doing? Why are you having him read that
19 in? Why don't you just reference it and hand it
20 to me in a Xerox? Is there another game going on?

21 MS. POOLE: Well, I'd be happy to do
22 that, but we've had --

23 PRESIDING MEMBER MOORE: Well, I'm not
24 an air chemist, I'm not a soil chemist, I'm not a
25 water chemist, I'm an economist. But I can read

1 numbers. Why are you doing it this way?

2 MS. POOLE: I would be happy to provide
3 this into the record as an exhibit.

4 PRESIDING MEMBER MOORE: And it's not
5 just directed at you. I mean, other -- perhaps
6 I'm just missing something here when we have the
7 opposing witness -- I don't know whether it's to,
8 you know, make someone look like they're coming
9 over to your side or what. But, you know what,
10 we're all adults here. I can take tables if
11 they're --

12 MS. HOLMES: I'm going to object if
13 there's going to be a proposal to identify a new
14 exhibit at this late date that gets introduced
15 into the record.

16 PRESIDING MEMBER MOORE: I don't want to
17 identify a new exhibit. I'm just saying, -- go
18 ahead and finish --

19 MR. STEIN: I'm not sure where I left
20 off.

21 PRESIDING MEMBER MOORE: But I think
22 if -- I'm sorry, Ms. Hough, but if my point was
23 too esoteric, you know, we can all discuss it
24 after this hearing is over. But I think
25 everyone's getting what I'm saying. Go ahead and

1 continue.

2 MR. STEIN: If 0.9 times the NOx max
3 value is greater than ozone ambient, then set NO2
4 max equal to ozone ambient plus 0.1 times NOx max.

5 Four. NO2 max computered for the point
6 source is added to the NO2 background. I'd just
7 note that this is entirely consistent with what I
8 was saying, which is that one should be taking
9 hour by hour measurements for purposes of applying
10 this procedure. There's --

11 MS. POOLE: Thank you, Mr. Stein. This
12 is also for Mr. Stein. What's the lower limit of
13 detection for the cadmium hydroxide method?

14 MR. STEIN: I don't know.

15 MS. POOLE: Is this method portable?

16 MR. STEIN: I don't know.

17 MS. POOLE: At the previous hearings you
18 introduced a community monitoring plan for Avila
19 Beach into the record. Isn't it true that within
20 that community monitoring plan CARB approved the
21 use of the Jerome equipment for the Avila project
22 for monitoring H2S?

23 MR. GALATI: I don't know if that
24 testimony was elicited earlier of Mr. Stein. I
25 think you mischaracterized his testimony. I don't

1 think he testified to those sections of the Avila
2 Beach community plan that you are --

3 MS. POOLE: No, but he would testify to
4 the fact that CARB had not proved the use of the
5 Jerome equipment to measure H2S. And I'm asking
6 him, whether in the community monitoring plan CARB
7 and other agencies approved the use of the Jerome
8 equipment to measure H2S.

9 HEARING OFFICER FAY: The Jerome
10 equipment, was that the gold foil method referred
11 to by Mr. Stein?

12 MS. POOLE: That's correct.

13 MR. STEIN: I don't know the answer to
14 that question.

15 MS. POOLE: Ms. Fields.

16 MS. FIELDS: Yes.

17 MS. POOLE: In the nonroad emission
18 factors which you used in the introduction it
19 states, to better characterize emissions for more
20 recent precontrolled engines, EPA analyzed
21 available emission test data on 1988 to 1995
22 nonroad diesel engines.

23 Does that change your testimony?

24 MR. GALATI: Excuse me, just a minute,
25 excuse me. Counsel, what are you reading from?

1 MS. POOLE: I'm reading from the
2 document that Ms. Fields used to estimate her
3 drill rig emissions.

4 MR. GALATI: If you have a copy and you
5 can allow Ms. Fields to refresh her recollection,
6 or even verify it is the document she used.

7 MS. FIELDS: It appears to be the
8 document that we used, yes. And it says test data
9 on 1988 to 1995 nonroad diesel engines.

10 MS. POOLE: And does that change your
11 previous testimony?

12 MS. FIELDS: No.

13 MS. POOLE: Thank you. That's all I
14 have.

15 HEARING OFFICER FAY: Thank you. That
16 concludes our testimony on indirect impacts, air
17 quality impacts.

18 Okay, now I'd like to ask Mr. Pryor if
19 he knows, do we have any connection with EPA at
20 1:30? We don't.

21 MS. HOLMES: I talked with EPA and they
22 think it's sufficient that I just relay to the
23 Committee and the parties where they are in the
24 process of resolving the violations. And when we
25 get to -- I don't know if you want me to discuss

1 that now, or if we can discuss it at the time when
2 we talk about scheduling matters, it doesn't
3 matter.

4 PRESIDING MEMBER MOORE: This is as good
5 a time as any.

6 HEARING OFFICER FAY: We're at a break
7 between the end --

8 PRESIDING MEMBER MOORE: Yes.

9 HEARING OFFICER FAY: -- of indirect and
10 the beginning of cumulative.

11 PRESIDING MEMBER MOORE: Caryn, could
12 you identify who you talked to?

13 MS. HOLMES: Yeah, I talked with Rob
14 Mullaney, who I believe is with their office of
15 counsel. He's the person who did most of the
16 talking in the conversation we had at the previous
17 hearing.

18 He said that EPA had sent out a letter
19 requesting quite a bit of information. That
20 Texaco had made a preliminary filing with some of
21 the data. He said that he was encouraged by the
22 fact that they would seem to want to resolve
23 issues, but that they had -- some of their
24 concerns were actually stronger now than they had
25 been before.

1 I asked what that meant in terms of time
2 and he said he thought that if, with the
3 indication that he'd had so far that Texaco wanted
4 to move on getting the issues resolved, that we
5 were talking anywhere from weeks to some months.
6 But certainly not stretching out into the years
7 timeframe, which was my concern.

8 So he wasn't able to be more specific
9 than that, and I'm sorry that he wasn't able to
10 talk to you directly.

11 So, it sounds to me as though what
12 they're telling us is that they believe that the
13 issue could be resolved within a few months. But
14 that's my interpretation of weeks to some months.

15 HEARING OFFICER FAY: Do you have an
16 opinion of the impact on this proceeding?

17 MS. HOLMES: I think staff, when we get
18 to the -- I can do it now, but we do have a --
19 staff does have a recommendation about how we
20 should proceed from here in light of that
21 information. Is that what you're looking for?

22 HEARING OFFICER FAY: Are you ready to
23 give the recommendation now?

24 MS. HOLMES: That's fine. It appears to
25 us that the violations are obviously in no way

1 related to the Sunrise facility, which obviously
2 isn't up and operating yet. It doesn't appear to
3 us that there's any way in which the resolution of
4 the violations could have any impact on the
5 conditions that would apply to the Sunrise
6 facility.

7 Given that, it seems to me that what
8 we're left with is a situation where there's a
9 potential noncompliance with laws that is not
10 going to -- the resolution, which will not affect
11 the terms and conditions of any Commission
12 decision.

13 Therefore, staff's recommendation is
14 that the record be closed on every issue except
15 this, and then if there's an unresolved issue as
16 to water or to the phase 2, with that, as well.
17 And that the Commission proceed with its process
18 of drafting a proposed decision.

19 Staff would not recommend that the
20 Commission adopt a final decision in the face of a
21 noncompliance.

22 PRESIDING MEMBER MOORE: And, Caryn,
23 that -- sorry, Ms. Holmes, that would then put us
24 in a position potentially where the PMPD would be
25 literally open potentially for months, is that

1 right?

2 MS. HOLMES: I think that what I'm
3 saying is that the PMPD could be issued, and it
4 would presumably note the potential violation as
5 an outstanding issue. And the record could be
6 reopened, or could be revisited when EPA informs
7 the Commission or the Committee that the issue is
8 resolved.

9 PRESIDING MEMBER MOORE: But as a
10 practical matter then the Commission, itself, the
11 Energy Commission wouldn't be able to take action
12 on that proposed decision until that issue was
13 resolved.

14 MS. HOLMES: One option that the
15 Commission will undoubtedly consider in that
16 situation would be whether to grant, in essence, a
17 conditional decision. Staff does not recommend
18 that the Commission do that.

19 PRESIDING MEMBER MOORE: Right. Okay, I
20 think what we have is just in the interests of
21 full disclosure. I mean right now Ms. Holmes'
22 point is not debatable, other than just it's your
23 reporting. If someone has different information
24 we probably ought to get it on the table right
25 now. But for all intents and purposes I'll take

1 that under advisement. And then when we wrap up
2 this afternoon we'll include those comments in the
3 consideration of where we go next schedule-wise.

4 Mr. Grattan, you have a comment?

5 MR. GRATTAN: If I understand you
6 correctly, Commissioner, the time to speak to
7 staff recommendation is during the wrap-up this
8 afternoon?

9 PRESIDING MEMBER MOORE: Well, I think
10 so. I mean if you have something you want to
11 add --

12 MR. GRATTAN: No, I have no quibble with
13 the information as reported. We'd just like to
14 later comment on the staff recommendation.

15 PRESIDING MEMBER MOORE: Okay. Well,
16 anybody with any newer or different information
17 than that, this is probably a good time to get it
18 on the table.

19 MR. GRATTAN: I'm sorry, before we
20 forget -- before I forget. Sayed Sadredin, the
21 permit officer from the San Joaquin Valley Unified
22 Air Pollution Control District was standing by to
23 participate in the EPA phone call. But he is
24 still -- there are questions that relate to the
25 Valley's regulatory program for well drilling,

1 which he has informed us he would like to address
2 and he would be available by telephone.

3 PRESIDING MEMBER MOORE: Well, I'm not
4 sure that does us any good without having the EPA
5 people --

6 MR. GRATTAN: This has nothing to do
7 with the EPA enforcement issue. This has to do
8 with the indirect impacts with regard to well
9 drilling, which have been just discussed here.

10 PRESIDING MEMBER MOORE: Well, all
11 right. I mean, we're in that zone, should we get
12 him on the phone and everyone agree --

13 MS. POOLE: I would like to address one
14 point that Ms. Holmes made that doesn't go to her
15 recommendation, but she mentioned that staff has
16 concluded that the violations don't affect this
17 project.

18 We disagree with that. The violations,
19 as we heard EPA describe them, are related to
20 vapor recovery on wells, and on other equipment in
21 the oil field. And it may very well impact the
22 quantity of indirect emissions associated with
23 this project as well as cumulative.

24 PRESIDING MEMBER MOORE: In saying that,
25 then, Ms. Poole, what you're offering to the

1 Committee is a legal opinion about the nature of
2 those violations as opposed to an opinion about
3 what they mean in terms of air quality or that
4 type of impact, something to do with, for
5 instance, Dr. Fox's testimony.

6 What you just said is your legal opinion
7 about the linkage between the NOV's and not the air
8 quality.

9 MS. POOLE: To some extent,
10 Commissioner, but it's also there's just been this
11 debate about what percent vapor recovery do you
12 assume, for example, on wells and other things.
13 This goes directly to that.

14 If there's no vapor recovery system on
15 these wells, then that impacts that discussion
16 heavily.

17 MR. GRATTAN: If I might respond to that
18 briefly. The alleged violations have nothing to
19 do with the Midway Sunset oil field, and
20 particularly nothing to do with the 700 wells
21 which are identified as the indirect impacts.

22 And we can let Mr. Sadredin speak to the
23 district's requirements for vapor recovery.

24 PRESIDING MEMBER MOORE: Okay, I think
25 that Ms. Holmes made your point for you a couple

1 of minutes ago on that. And I understand, Ms.
2 Poole, what you said. And I'm certain that my
3 attorney understood it and will decipher it for me
4 in caucus later.

5 Okay, shall we see if we can get the San
6 Joaquin representative on the phone? And Marc
7 looks like he --

8 HEARING OFFICER FAY: He's going to help
9 us out here.

10 (Pause.)

11 MR. SADREDIN: Hello.

12 MR. PRYOR: Hello, Mr. Sadredin, this is
13 Marc Pryor at the Energy Commission.

14 MR. SADREDIN: Yes.

15 MR. PRYOR: We're in a hearing for
16 Sunrise. Commissioner Moore is presiding. Gary
17 Fay is the Hearing Officer. I'll turn you over to
18 Mr. Fay.

19 HEARING OFFICER FAY: Good morning --
20 goof afternoon. We have just completed taking
21 testimony on the indirect impacts of the Sunrise
22 project. And on air quality and those, as you
23 know, I think you know those impacts encompass the
24 700 wells within a three-quarter mile radius of
25 the project.

1 And I understand that the applicant
2 wanted you to shed some further light on this
3 discussion.

4 Mr. Galati, do you have some --

5 MR. GALATI: Yes, thank you. And, Mr.
6 Sadredin, the issue that we're discussing now is
7 not associated with the EPA call that you may have
8 thought you'd be participating in today. I just
9 wanted to let you know that's not what we're
10 discussing.

11 Mr. Sadredin, there's been some
12 confusion as to the requirements and the
13 regulatory program for new wells that are
14 permitted by the district in the Midway Sunset
15 field, specifically the 465 new production wells
16 and the 135 steam wells that may be associated
17 with the Sunrise project.

18 Could you please explain the regulatory
19 program with respect to the control of emissions
20 for those new wells?

21 HEARING OFFICER FAY: Mr. Sadredin,
22 before you do, are you willing to respond to
23 questions as a witness under oath, because --

24 MR. SADREDIN: Sure.

25 HEARING OFFICER FAY: -- I believe you

1 were previously sworn in this proceeding, is that
2 correct?

3 MR. SADREDIN: Yes.

4 HEARING OFFICER FAY: Yes, and so you
5 remain under oath, and I just wanted to have that
6 understanding on the record. Please go ahead.

7 MR. SADREDIN: Basically the entire
8 process is regulated and permitted by the
9 district, so they are subject to a number of
10 regulations for various devices that are involved
11 and various processes that are involved in oil
12 production and storage, and various transfers that
13 are involved.

14 Do you want me to just go through each
15 step and say what the various requirements are, or
16 do you want to ask specific questions?

17 MR. GALATI: Well, I guess I'll go ahead
18 and ask some specific questions.

19 DIRECT EXAMINATION

20 BY MR. GALATI:

21 Q Specifically, with respect to VOC
22 emissions, could you please describe to us whether
23 VOC emissions are controlled from new wells, and
24 specifically from the wells, and how they're
25 controlled?

1 A There are a number of emission points
2 involved in the process, and we have a number of
3 regulations that apply. District rule 4401, for
4 instance, applies to emissions from the wellheads
5 in case they have vents, and that requires 99
6 percent control at that point.

7 Later on, as the oil is pumped out of
8 the well it goes to storage tanks and various
9 water separation devices, but mainly storage tanks
10 that perform that function. And those are subject
11 to a district rule for storage and transfer of
12 organic liquids which require 95 percent or higher
13 emissions control.

14 And then the entire process is subject
15 to district new source review rule, which requires
16 best available control technology. For much of
17 this process BACT, or best available control
18 technology is 99 percent control. And after you
19 apply those controls whatever emissions are
20 remaining after that, increase in emissions, those
21 would have to be offset by emission reduction
22 credits.

23 MR. GALATI: I think that clears up some
24 confusion here, and I don't really have any more
25 questions for you, Mr. Sadredin.

1 MR. SADREDIN: There was one thing, if I
2 might, and I had my staff look at CURE's estimated
3 emissions of VOCs, and also the H2S emissions.
4 And we found some gross oversight or errors in
5 that basically the emissions are about nine or ten
6 times higher than what we would estimate. So I
7 don't know if that's beneficial to go through that
8 or not, but that was one thing that we were
9 concerned with.

10 MR. GALATI: Yes, I think that's
11 important, if you would like to go through that.

12 MR. SADREDIN: Well, basically CURE, in
13 their estimated emissions, the VOC emissions, they
14 are double-counting some emissions from the well
15 vents. And they are using an outdated emission
16 factor that we don't use except in cases where we
17 don't have that accurate information on the number
18 of fugitive components and related processes.

19 For instance, if you look at their
20 calculations they estimated fugitive emissions at
21 57.9 tons per year using the component counts that
22 Texaco had provided. In other words, how many
23 components you would have that might have leaked
24 at certain times.

25 And then in addition to that, they also

1 assumed 314 pounds per well per day emission
2 factor.

3 The fugitive component count really
4 takes care of quantifying the emissions. In cases
5 when you do have the component counts that's all
6 you use to calculate emissions. And you don't use
7 this old emission factor that we used to use as a
8 conservative emission. That's when we didn't have
9 more accurate information.

10 But basically our VOC emissions
11 estimates would be 60.7 tons per year versus the
12 463-some tons that CURE had estimated.

13 And as far as H2S emissions go, they
14 rely on this inaccuracy from the VOC emissions.
15 In other words, the way they calculated the H2S
16 emissions they took their VOC emission estimate
17 and assumed a certain percentage of that would be
18 VOC.

19 So, starting with a wrong number on that
20 front, you end up with wrong H2S emissions to
21 begin with.

22 But additionally they made one other
23 assumption that is not accurate. And that relates
24 to the 10,000 ppm, that concentration of H2S that
25 they used, which is five times higher than what

1 our rules allow. Our district rule 4801 only
2 allows 2000 ppm of H2S concentration.

3 And so there are two problems. One, the
4 underlying VOC emissions that they then used to
5 calculate the H2S emissions are about ten times
6 higher to begin with. And then the concentration
7 that they assumed is about five times higher than
8 what our rules require for H2S.

9 MR. GALATI: Mr. Sadredin, I don't have
10 any more questions for you. The Committee or
11 staff or CURE might.

12 HEARING OFFICER FAY: Do any of the
13 parties wish to cross-examine Mr. Sadredin?

14 MS. HOLMES: Staff does not.

15 HEARING OFFICER FAY: CURE, any
16 questions?

17 MS. POOLE: Well, is Dr. Fox going to be
18 permitted to respond to this?

19 MR. SADREDIN: I'm sorry, I can't hear
20 you.

21 MS. POOLE: I'm not asking you a
22 question yet, Mr. Sadredin.

23 MR. SADREDIN: Oh.

24 HEARING OFFICER FAY: No. The district
25 director is here available as a witness through

1 the telephone, and is subject to cross-
2 examination. But that's the extent of it.

3 MS. POOLE: May we have just a moment.

4 HEARING OFFICER FAY: Mr. Sadredin,
5 we're holding on for just a moment.

6 MR. SADREDIN: Okay.

7 (Pause.)

8 MS. HOLMES: Mr. Fay, I have one
9 question in the interim, I guess.

10 CROSS-EXAMINATION

11 BY MS. HOLMES:

12 Q Earlier today, Mr. Sadredin, one of the
13 staff witnesses testified that, I believe it was
14 Mr. Gruber of the district had told him that the
15 BACT levels for the wells and the associated
16 equipment were 99.9 percent. Earlier today did
17 you say that they were 99 percent? That that's
18 the correct figure?

19 A There are two components involved here.
20 The well vent rule requires 99 percent total
21 control overall. And there are two components to
22 these emissions. You have fugitive leaks from
23 various valves and flanges and so forth. And then
24 you have some of the emissions that are captured
25 and go to an incineration device.

1 Whatever goes to the incineration device
2 is actually controlled by more than 99.9 percent
3 through incineration. Most of that is basically
4 like natural gas and it's fully combusted in that
5 process. So that component, that part of it, we
6 believe, is controlled by more than 99.9 percent.

7 You will have some fugitive emissions
8 that do not make it to the, perhaps to the
9 incineration device, depending on how many
10 components or leaky components you might have.
11 And total, whatever comes out of the incineration
12 device and whatever fugitive emissions that you
13 have that may be lost, the total losses cannot be
14 more than 1 percent of the overall. The control
15 has to be 99 percent.

16 And that's what the rule requires. But
17 in practice, because of the incineration, you
18 would get most of the emissions at 99.9 percent
19 control.

20 MS. HOLMES: Thank you, that's very
21 helpful.

22 HEARING OFFICER FAY: CURE, anything
23 further?

24 //

25 //

1 CROSS-EXAMINATION

2 BY MS. POOLE:

3 Q There's nothing that actually requires
4 99.9 percent control?

5 A I'm sorry, I didn't catch that.

6 Q I'm asking if there's any rule that
7 requires 99.9 percent control?

8 A If we do determine that 99.9 percent is
9 achievable, that becomes best available control
10 technology, and it could be required as a best
11 available control technology under our new source
12 review rule.

13 Q Has the district determined that 99.9
14 percent control is achievable control technology?

15 A For certain operations of certain
16 petroleum products, obviously it has been
17 demonstrated for a number of years now that they
18 could be cost effectively ducted to an
19 incineration device that does achieve more than
20 99.9 percent --

21 Q Mr. Sadredin, I'm focusing specifically
22 on the wells and the heavy crude oil that we're
23 talking about here. Has the district determined
24 that 99.9 percent control is achievable given
25 those inputs?

1 A For control of emissions from tanks and
2 other components that go to the incineration
3 device, yes, 99.9 percent is achievable.

4 Q And from wells?

5 A Yes, from wells, if you do duct those
6 emissions from the well vents, for instance, to an
7 incineration device. Or if they route it through
8 the tanks to an incineration device.

9 Again, that component of it, you
10 wouldn't still have fugitive components that are
11 not controlled, that are not incinerated. And
12 those are basically controlled through ongoing
13 inspection and maintenance of the leaky
14 components.

15 Q I'm sorry, I'm confused here. Has the
16 district made a determination that BACT for vapor
17 recovery on wells for heavy crude oil is 99.9
18 percent?

19 A We have made a determination that BACT
20 is ducting them to an incineration device. We
21 identified that by the type of control equipment
22 that is required. And it has been well documented
23 that the control equipment that we specify as our
24 BACT is, in fact, more than 99.9 percent efficient
25 just because these vapors are easily combustible

1 in the incineration device.

2 Q So is the answer yes?

3 A Yes, for the emissions that are ducted
4 to an incinerator, yes.

5 Q And that's for VOCs?

6 A Sorry?

7 Q That control efficiency is for VOCs?

8 A It's for VOCs and also the sulfur
9 components that would also combust within the
10 incineration device. If you have H₂S, for
11 instance, those are easily combustible also, and
12 we assume 100 percent conversion basically of the
13 sulfur to sulfur oxide and other combustion
14 components.

15 Q Have you confirmed this level of
16 recovery with source tests?

17 A Your question, have we confirmed this
18 with source tests?

19 Q That's right.

20 A Normally we don't require source
21 tests --

22 Q Thank you.

23 A -- in situations when --

24 Q Thank you, Mr. Sadredin, that was my
25 question.

1 MS. POOLE: That's all my questions.

2 HEARING OFFICER FAY: Okay, thank you.

3 Thank you very much for participating in our
4 hearing. I believe that includes all the
5 questions. So we'll say goodbye.

6 MR. SADREDIN: Am I still on for the EPA
7 section or am I done today?

8 MR. GALATI: You're done today.

9 MR. SADREDIN: Thank you.

10 HEARING OFFICER FAY: All through.

11 Okay. Are the parties ready to move on
12 to offering testimony on cumulative impacts?

13 MS. HOLMES: If I could beg your
14 indulgence, we have a witness that I believe you'd
15 requested to talk to you about DTSC. He's been
16 sitting here all day. If we could get him on that
17 would be helpful.

18 HEARING OFFICER FAY: Oh, you mean about
19 the phase 2?

20 MS. HOLMES: Yes.

21 HEARING OFFICER FAY: Okay, sure.

22 MS. HOLMES: Mr. Ringer has already been
23 sworn.

24 HEARING OFFICER FAY: Mr. Ringer, you're
25 still under oath.

1 DIRECT EXAMINATION

2 BY MS. HOLMES:

3 Q Mr. Ringer, are you responsible for
4 insuring coordination with DTSC under the CEC's --
5 I hate to speak in acronyms -- MOU with DTSC?

6 A Yes.

7 Q Can you explain what's happened to date
8 with that process?

9 A Yes, when we received the phase 2
10 environmental site assessment at the end of
11 November I sent that down to Kevin Shaddy in the
12 Clovis office of DTSC. And on January 12th I had
13 talked to him regarding where he was in his
14 analysis -- on January 13th, excuse me.

15 And at that time we talked a little bit
16 about the arsenic levels and some of the things
17 that might have been a concern.

18 And he said that in general if you
19 looked at the preliminary remediation goals that
20 the levels of arsenic that were found in the phase
21 2 site assessment were within the range that he
22 would consider acceptable clean-up criteria for an
23 industrial site.

24 And that typically these types of levels
25 don't result in a need for remediation.

1 He said that it would be useful to have
2 some indication of the background levels of
3 arsenic down there to compare these two. There
4 was no indication in the environmental site
5 assessment, itself, as to what normal background
6 levels of arsenic were down in the oil field.

7 And he said that there was no data on
8 semi volatile compounds, and that potentially
9 could be a gap in the data. He didn't say that it
10 was a problem, he just said that that would be
11 more complete information.

12 Q Have you had any subsequent
13 conversations with DTSC?

14 A I talked to him today and he pretty much
15 reiterated the same thing.

16 MS. HOLMES: Thank you. I think that's
17 the information we have.

18 HEARING OFFICER FAY: All right, thank
19 you for your update.

20 MS. POOLE: May I ask a quick question?

21 HEARING OFFICER FAY: Yes.

22 CROSS-EXAMINATION

23 BY MS. POOLE:

24 Q What are semi volatiles?

25 A Compounds that are a little bit heavier

1 than volatile compounds. They don't volatilize
2 quite as rapidly.

3 HEARING OFFICER FAY: Mr. Ringer, could
4 you be sure to speak right into the microphone,
5 please.

6 BY MS. POOLE:

7 Q Would those include PAH's and PCB's?

8 A Yes.

9 Q And did you send a full copy of the
10 phase 2 to DTSC?

11 A I sent the -- I'll tell you exactly what
12 I sent -- I sent the first portion of it, which
13 includes everything from the introduction to the
14 conclusions and recommendations.

15 I sent him the tables, table 1A --
16 there's two table 1A's, table 1B and 2B. And I
17 believe some of the figures.

18 Q Okay. Did you send him the soil gas
19 data from the phase 2?

20 A To the extent that it was in the tables.
21 The tables have summary of analytical results
22 including VOCs, TPHs.

23 Q You sent him appendix C?

24 A No.

25 Q Thanks.

1 PRESIDING MEMBER MOORE: Questions, Mr.
2 Galati?

3 MR. GALATI: I just have one question.

4 PRESIDING MEMBER MOORE: Mr. Ringer,
5 there's one more question for you.

6 CROSS-EXAMINATION

7 BY MR. GALATI:

8 Q Mr. Ringer, does the information that
9 you have now change your conclusions or
10 recommendations in the waste section of the FSA?

11 A No, it doesn't. I wouldn't expect that
12 DTSC would take any further action even after
13 seeing additional information.

14 MR. GALATI: Okay, thank you.

15 HEARING OFFICER FAY: Thank you, Mr.
16 Ringer, you're excused.

17 Mr. Galati, are you ready to go forward
18 on cumulative impacts?

19 MR. GALATI: Yes, we are. The record
20 would reflect that Mr. Dave Stein and Ms. Paula
21 Fields are still sworn and the panel regarding
22 cumulative impacts.

23 DIRECT EXAMINATION

24 BY MR. GALATI:

25 Q Ms. Fields, would you please summarize

1 your previously filed testimony that you
2 previously affirmed under oath regarding the
3 cumulative impact section?

4 A Yes, thank you. Again, I supervised and
5 assisted in the preparation of the sections of the
6 AFC on the subsequent submittals related to
7 cumulative air quality impacts associated with the
8 Sunrise project.

9 Cumulative impacts include air emissions
10 from construction and operation of the Sunrise
11 project along with two other projects located
12 within six miles of Sunrise. Those are the
13 LaPaloma and the Elk Hills projects.

14 There's a couple of issues I'd like to
15 summarize that were contained in my earlier
16 testimony. First of all, with regard to
17 construction. Cumulative construction impacts
18 from all three plants will be mitigated through
19 compliance with district regulation 8 for control
20 of fugitive dust.

21 And in addition, Sunrise will provide
22 mitigation of PM10 from construction by
23 surrendering ERCs prior to commencement of
24 construction.

25 With regard to operation. Using full

1 load emission estimates for LaPaloma and Elk
2 Hills, along with start-up emissions scenario for
3 Sunrise, we modeled the one-hour and annual NO2
4 impacts, and the 24-hour and annual PM10 impacts
5 from those three projects.

6 The CO and SO2 impacts were expected to
7 be well below the ambient air quality standards,
8 so we didn't analyze those in detail in the
9 cumulative analysis.

10 The results of our modeling show that no
11 new violation of the PM10 standard or any
12 violation of the NO2 standards would occur.

13 This is the same conclusion made by
14 staff, even though their analysis was conducted
15 using different data.

16 The three projects will contribute to
17 existing violations at the PM10 ambient air
18 quality standard, but each project will provide
19 PM10 offsets to mitigate their impacts.

20 Thank you.

21 HEARING OFFICER FAY: Thank you.

22 MR. GALATI: The panel is available for
23 cross-examination.

24 HEARING OFFICER FAY: Staff?

25 MS. HOLMES: No questions.

1 HEARING OFFICER FAY: CURE?

2 MS. POOLE: No questions.

3 HEARING OFFICER FAY: All right. Is
4 staff ready to testify on cumulative impacts?

5 MS. HOLMES: We call Mr. Loyer.

6 HEARING OFFICER FAY: Mr. Loyer, you're
7 still under oath.

8 DIRECT EXAMINATION

9 BY MS. HOLMES:

10 Q And ask you to very briefly summarize
11 your conclusions with respect to cumulative
12 impacts.

13 A Sure. For the Sunrise project we
14 analyzed several areas including the TCI main
15 utility corridor, the Kern County additional power
16 plant projects, the Midway Sunset oil field
17 expansion and secondary pollutant impacts
18 including ozone and PM10.

19 For the TCI -- well, for all areas we
20 found no expectation that there would be any
21 significant air quality impacts from any of these
22 sources.

23 Q Does that conclude your summary?

24 A Yeah, I'm going to keep it simple today.

25 (Laughter.)

1 MS. HOLMES: Thank you. Mr. Loyer is
2 available for cross-examination.

3 HEARING OFFICER FAY: Applicant?

4 MR. GALATI: No cross.

5 HEARING OFFICER FAY: CURE?

6 MS. POOLE: No questions.

7 HEARING OFFICER FAY: Okay. CURE, do
8 you have testimony on cumulative impacts?

9 MS. POOLE: We'll just stand by our
10 written testimony.

11 HEARING OFFICER FAY: Okay. Very good.
12 That bring us to --

13 PRESIDING MEMBER MOORE: Yes, if you'll
14 give us five minutes we'll take a break; and then
15 we'll come back and talk about scheduling.

16 (Brief recess.)

17 PRESIDING MEMBER MOORE: Let's go back
18 on the record and let me just start by saying that
19 I commend everyone for their efforts. This is
20 clearly a very complex case and we will be
21 challenged trying to put together a record from
22 the testimony that's been given. We'll obviously
23 do our best to make it as clear and fair as we
24 possibly can.

25 Basically the record is closed. We will

1 recognize Mr. Galati and ask him to tell us about
2 the materials that he told us about during the
3 break that had been docketed. And I understand
4 that CURE has a copy of the docketed materials.

5 MS. POOLE: We do. We'll be objecting
6 to its entry as an exhibit, however.

7 MR. GALATI: Let me first identify it.

8 HEARING OFFICER FAY: Let's let him go
9 first.

10 MR. GALATI: I'll identify it and have
11 an offer of proof in light of the pending
12 objection.

13 January 27, 2000 it was docketed. It is
14 a declaration of John Haley. This was in
15 response, -- it is in response to rebuttal
16 testimony. Mr. Haley could be available for
17 cross-examination if necessary.

18 It is specifically rebutting the issue
19 of Avila Beach community plan and the use of soot
20 filters on that project.

21 And I would just like to remind the
22 Committee that this was testimony that had come
23 out in rebuttal by CURE due to staff's
24 modification into leading soot filters. And as
25 they were surprised by that information, were able

1 to bring witnesses at that time, we scrambled the
2 best we could do during the last hearings, were --
3 was a oxidation catalyst specialist.

4 We also heard in public health testimony
5 quite a bit of testimony about the Avila Beach
6 community project. We were able to discover
7 someone who has experience with the Avila Beach
8 community project. We just received this
9 yesterday and we docketed it yesterday, faxed it
10 to CURE.

11 There's two parts to it. There is the
12 actual declaration of Mr. Haley with an attachment
13 A of his statement of qualifications, actually
14 three parts. And the third part, which we think
15 is most important, is a letter from San Luis
16 Obispo. In fact, Robert Carr, discussing the soot
17 filter.

18 Since the Commission is dealing with
19 this issue in this case and others, we think that
20 this would be beneficial information to help the
21 Committee decide the appropriate mitigation and
22 the cost and efficiency of soot filters.

23 I'm sorry, it was the San Luis Obispo
24 Air Pollution Control District letter, not from
25 this district. That's the district associated

1 with the Avila Beach project.

2 HEARING OFFICER FAY: Right, understand.

3 Okay, Ms. Poole, do you have objection?

4 MS. POOLE: Thank you. We do object to
5 this testimony coming in now. It goes to
6 construction emissions from the project. The
7 record was closed on that January 11th.

8 Mr. Galati is correct. CURE did put on
9 rebuttal testimony to some late changes that came
10 in from staff on January 10th. And the applicant
11 has, in fact, already put on a rebuttal witness to
12 our rebuttal testimony. That happened on January
13 11th.

14 This is just way too late, and you know,
15 they've already had their opportunity to do
16 rebuttal here.

17 HEARING OFFICER FAY: All right, does
18 staff want to wade in on this, also?

19 MS. HOLMES: Staff would prefer to duck.

20 HEARING OFFICER FAY: Okay.

21 (Laughter.)

22 HEARING OFFICER FAY: Thank you for your
23 precise comment.

24 I think in light of the give and take
25 that we've observed trying to be equitable to

1 everybody, we're going to uphold the objection.

2 But I see no reason not to receive this as

3 comment. We have a lot of evidence on soot

4 filters. We can use this to flesh it out. We

5 can't make any findings based on it. To that

6 extent you're disadvantaged.

7 But I think in fairness, we've been back

8 and forth on this, and we're sort of tired of soot

9 filters.

10 PRESIDING MEMBER MOORE: And obviously

11 I'm in concurrence with that. I guess the only

12 thing I would add is I'm sorry that we didn't get

13 these cost numbers. It doesn't seem to me that

14 they, from what I've just scanned of this very

15 fast, that as Mr. Fay said, they simply add depth

16 to what we've been hearing.

17 So, we'll receive them.

18 Let's go on to scheduling matters. The

19 evidentiary hearings are closed.

20 MS. POOLE: May I move my air quality

21 exhibits into the record first?

22 PRESIDING MEMBER MOORE: Oh, yes, excuse

23 me --

24 MR. GALATI: I have some housekeeping

25 along those lines, too.

1 PRESIDING MEMBER MOORE: Boy, that word
2 housekeeping.

3 HEARING OFFICER FAY: Mr. Galati, why
4 don't we go first with you and your housekeeping.

5 MR. GALATI: Thank you. I'd like to
6 move in exhibit 49, exhibit 50, exhibit 51, and
7 exhibit 53.

8 Also I would like to, exhibit 59, 60,
9 exhibit 65, exhibit 66, 67, 68, 69, 70, 71, 73,
10 79, 80, 81, 83, 84 and 85, 88, and I'm at a loss
11 here -- I believe I'd already asked for the water
12 quality 102, 103 -- excuse me, 102 to be received
13 into evidence today.

14 HEARING OFFICER FAY: All right, is
15 there objection? All right, those are all moved
16 into evidence if they have not been so moved
17 already.

18 You're responding to the blanks on the
19 exhibit list, is that --

20 MR. GALATI: Yes, I was. I did notice
21 that some said they were sponsored by the
22 applicant when I'm not sure they were, so I
23 skipped over them if they weren't.

24 HEARING OFFICER FAY: And I invite the
25 parties to get corrections to me as soon as

1 possible on the exhibit list, and we'll review
2 them and reissue the list.

3 All right, staff, any last minute
4 things?

5 MS. HOLMES: Well, just that there are a
6 number of the same exhibits with blanks next to
7 them that are sponsored by staff that I thought
8 had been introduced.

9 HEARING OFFICER FAY: And they may have.
10 If you believe they have, I wouldn't be concerned.

11 MS. HOLMES: Well, --

12 HEARING OFFICER FAY: Blanks do not --

13 MS. HOLMES: Can I please read them just
14 to be --

15 HEARING OFFICER FAY: Sure, okay.

16 MS. HOLMES: It's 41, 42, 54, 55, 63,
17 64, 65, 67 and 66 read sponsored by the applicant.
18 I believe they were sponsored by staff. I thought
19 they were in evidence but if they're not I'd like
20 to move them at this point.

21 75, 76, 81, 86, 87, and 89. And I
22 believe -- I note that exhibit 47 was sponsored by
23 staff, not by the applicant.

24 HEARING OFFICER FAY: Yeah, I'd prefer
25 to get these comments in writing.

1 MS. HOLMES: Okay. I just want to make
2 sure that the exhibits that we --

3 HEARING OFFICER FAY: Okay, any
4 objection to moving those exhibits? I hear none,
5 so moved.

6 And CURE.

7 MS. POOLE: I'd like to move exhibits
8 56, 57, 58 and 61, which I believe CURE sponsored.
9 And I think these have already been moved in, but
10 to be sure, I'd also like to move exhibit 72, 77,
11 78, 82, and I believe that's it, into the record.

12 HEARING OFFICER FAY: Okay, and was
13 there testimony offered today that you wanted --

14 MS. POOLE: There was. I believe I've
15 already moved those in, but those were exhibits
16 103, 104, 105 and 106.

17 HEARING OFFICER FAY: Okay. Any
18 objection to those exhibits listed? I hear none,
19 so moved.

20 Okay, anything further then before we
21 wrap things up?

22 MS. HOLMES: Just to make sure, one last
23 thing. To make sure that exhibits 84 and 85,
24 which I believe maybe neither one of us
25 identified, having to do -- they're letters from

1 San Joaquin County and a letter from the USEPA. I
2 just want to make sure they get moved into
3 evidence. I don't recollect whether --

4 MR. GALATI: Yeah, I just did that.
5 That was part of my list.

6 MS. HOLMES: I'm sorry.

7 HEARING OFFICER FAY: All right. Now,
8 do you have any scheduling concerns you want to
9 address?

10 MR. GRATTAN: Well, I have lots of
11 scheduling concerns, but we have a briefing
12 schedule and we are, I hate to use the word
13 comfortable, with that briefing schedule, but we
14 proposed it and it's an aggressive briefing
15 schedule, and we think we should keep it.

16 Applicant has proposed a schedule for
17 the remainder of the hearing process up to
18 decision. The Committee rejected that schedule.
19 And I believe that what we have on the table is to
20 plot out the rest of our days.

21 And we would propose -- I mean I haven't
22 seen a proposed counter schedule. We'd propose
23 working, if the idea is to work out getting to the
24 finish line, we would at least propose that you
25 look at our schedule we had proposed some months

1 ago.

2 HEARING OFFICER FAY: Any other
3 comments? Staff?

4 MS. HOLMES: No.

5 HEARING OFFICER FAY: CURE?

6 MS. POOLE: Just some remarks on EPA's
7 position. As you recall EPA did say the final DOC
8 for this project is not valid.

9 We don't see the advantage in moving
10 forward with air quality briefing and a decision,
11 proposed decision on that subject matter until we
12 know from EPA that it is valid.

13 MR. GRATTAN: If I can comment on that?

14 HEARING OFFICER FAY: Sure.

15 MR. GRATTAN: EPA has suggested, based
16 upon, by their own admission, not too much
17 evidence or not too much data that they didn't
18 like the DOC, based upon their view of the
19 conditions of certification.

20 I would like to point out that EPA is
21 not under either state or federal law in the
22 approval chain of the DOC. And that the Energy
23 Commission's statute and regulations are very
24 clear that this call is the air pollution control
25 officer of the related district's call.

1 And until a court overturns that, if a
2 court would dream of overturning it, we have a
3 valid DOC and the Commission has an obligation to
4 proceed on it.

5 MS. POOLE: Well, in fact, if I might
6 point out, EPA does have permitting authority in
7 the Title 5 permitting process. And these issues
8 will be addressed in that process. And EPA has
9 veto authority over a permit in that process.

10 MR. GRATTAN: And Sunrise doesn't need a
11 Title 5 permit until a year after operations.

12 PRESIDING MEMBER MOORE: Well, okay, at
13 this point then I respect those comments.
14 Clearly, they're on my mind. They were on my mind
15 when we opened this hearing this morning. And
16 they remain so.

17 We'll take your letter under advisement,
18 counselor. We're now in a mechanical zone where
19 we will move as rapidly as we can. I am advised,
20 and frankly, given the workload of everyone around
21 here, I think it's probably not beyond the realm
22 of imagination to see that the 60-day norm, the
23 rule, the windage number that people use for
24 getting a decision out is probably accurate. If
25 we can do it faster than that, we will.

1 As I said before, a very complex record.
2 There are two of us to debate this, and we will do
3 that. And we'll issue a letter as soon as we can
4 telling you what our intentions are as soon as we
5 can dial in our own workload and figure out how
6 rapidly we can close this down.

7 I'll have -- the decision will take
8 account of the federal issue. It will be included
9 in that. I can't tell you how we'll decide to
10 deal with it this instant, but it will be
11 accounted for.

12 Mr. Grattan, you look like you're
13 leaping for the illusive microphone.

14 MR. GRATTAN: No, I was struggling --

15 HEARING OFFICER FAY: You're opting for
16 the --

17 MR. GRATTAN: -- to hear.

18 HEARING OFFICER FAY: Seven-day
19 turnaround on the document, the cartoon version.

20 MR. GRATTAN: I'm not leaping toward
21 anything. I would -- staff has made a
22 recommendation with regard to the federal issue.
23 And I would presume that we would either have a
24 discussion on that now before the Committee ruled,
25 or that we would be able, in the course of our

1 final brief, to brief what we believe the
2 Committee should do with the federal issue in
3 terms of the final decision, the PMPD, and
4 construction.

5 HEARING OFFICER FAY: I think for
6 everybody's sake it would be better, rather than
7 to put everybody on the spot right now, to put
8 their last word on the record on this, since it
9 really is not a question of fact, why don't you
10 advise us in your briefs, in your air quality
11 briefs, on how you think the Committee should
12 handle the uncertainties that are out there vis-a-
13 vis EPA's apparent disagreement with the district.

14 And the Committee will truly seriously
15 consider that. There's really a wide range of
16 options. And anyway, we'll have you advise us on
17 that.

18 And I have ordered an expedite of this
19 transcript. My guess is that the transcript may
20 be available Wednesday to post. If we get it
21 Tuesday it will be posted probably Wednesday.

22 So, the parties are on notice that the
23 air quality brief is due ten days after the
24 transcript is posted. And then reply brief seven
25 days after that.

1 MR. GRATTAN: Mr. Hearing Officer, while
2 you're ordering up expedites, could you get one on
3 USEPA?

4 (Laughter.)

5 HEARING OFFICER FAY: And how much do
6 you think that would be worth?

7 (Laughter.)

8 HEARING OFFICER FAY: Anything else,
9 then, before we bid a fond farewell to our
10 evidentiary record?

11 Nothing.

12 PRESIDING MEMBER MOORE: We're
13 adjourned.

14 HEARING OFFICER FAY: Thank you.

15 PRESIDING MEMBER MOORE: Thank you, all.

16 HEARING OFFICER FAY: The record is
17 closed.

18 (Whereupon, at 2:37 p.m., the hearing
19 was closed.)

20 --o0o--

CERTIFICATE OF REPORTER

I, DEBI BAKER, an Electronic Reporter,
do hereby certify that I am a disinterested person
herein; that I recorded the foregoing California
Energy Commission Hearing; that it was thereafter
transcribed into typewriting.

I further certify that I am not of
counsel or attorney for any of the parties to said
Hearing, nor in any way interested in the outcome
of said Hearing.

IN WITNESS WHEREOF, I have hereunto set
my hand this 31st day of January, 2000.

DEBI BAKER

PETERS SHORTHAND REPORTING CORPORATION (916) 362-2345
